Slough, exhibited a good group of nine plants; they were not very large, but well flowered and nicely arranged as to colour. The varieties were *Cedo Nulli*, *Reine des Fleurs*, *Chelsoni*, *Duchesse Adelaide de Nassau*, *Souvenir du Prince Albert*, *Madame Cannar*, *d'Hanale*, *Ferdinand Kegeljan*, *Etendard de Flandret* and *Mons. Thibaut*. The same exhibitor showed a splendid group of eighteen plants in 9-inch pots, comprising the best varieties in cultivation. They were *Grandis*, *Duc de Nassau*, *Jean Vervaene*, *Charmer*, *Reine des Fleurs*, *Mlle. Marie Lefebvre*, *Mrs. Turner*, *Mons. Thibaut*, and one or two others.

**Orchids.**—These were very well shown. Four exhibitors came forward in the amateurs' class. Mr. Child was 1st. He had a very fine *Aerides Fieldingii*, with five spikes; a *Saccolabium retusum*, with three; *Lælia purpurata*, a fine form; and a good *Cypripedium barbatum superbum*. Mr. A. Cove, gr. to D. G. Straight, The Limes, Lower Tulse Hill, was 2d. He had a very good *Odontoglossum citrosomum* and a nice *Vanda suavis*. Mr. B. S. Williams, of Holloway, exhibited a very fine group of nine. It comprised *Cattleya Warneri*, *Epidendrum vitellinum majus*, *C. vexillarium*, *C. Alexandræ*, *Cypripedium barbatum superbum*, a *Lælia purpurata*, with eight spikes; *Cattleya Mossie*, *Masdevallia Lindeni*, and *Cypripedium niveum*. Mr. James, Castle Nursery, Lower Norwood, was 2d. He had a good *Dendrobium suavisimum*.

**Roses.**—The large specimens exhibited in the class for nine by Mr. Turner, were very grand, and gained the 1st prize. They were *Charles Lawson*, *Juno*, *Céline Forestier*, *Madame Lacharme*, *Duke of Edinburgh*, *La France*, &c. Messrs. Paul & Son, of Cheshunt, were very little behind; their plant of *Céline Forestier* was well flowered and of immense size; *Juno*, *Charles Lawson*, *Beauty of Waltham*, &c., were all very fine specimens. Mr. Turner also exhibited a good collection of eighteen plants in 9-inch pots, comprising a select assortment of the best Roses, all in good health and with superb blooms.

**Foliage Plants.**—This was a principal feature in the exhibition. Mr. Rann, gr. to S. Warren, Esq., Handcross Park, Sussex, showed splendid specimens far in advance of the other exhibitors: he gained 1st prizes in a collection of nine, for six *Crotons* splendidly grown, and also for nine *Dracenas*. Mr. B. S. Williams had the best foliage plants in the nurserymen's class, the best specimens in his collection being *Croton Hendersoni*, *Andreas*, *Youngii*, *angustifolius*, *majesticus* and *Williamsii*; *Dracena Goldiana*, *vivicans*, *superba*, *amabilis*, &c.; *Encephalartos Frederici Guilhelmi*, *Casuarina sumatrana*, &c.

Mr. B. S. Williams was 1st for a good group of Ferns; Mr. C. Horton, gr. to H. Moser, Esq., Benthall Hill, holding a similar position in the amateurs' class. Mr. Williams had handsome *Gleichenias*, and the other exhibitor a grand plant of *Adiantum cardiochloa*. Mr. Turner gained 1st prizes for stage and Fancy *Pelargoniums*; Mr. Laing, of Stanstead Park, Forest Hill, for flowering *Begonias*. Mr. Dobson, of Isleworth, gained a 1st prize for a group of nine *Calceolarias*, an equal award being given to Mr. Bird, gr. to J. A. Causton, Esq., West Dulwich. Mr. Dobson's was the best strain, and Mr. Bird had the best plants. Messrs. Laing, Messrs. B. Peed & Sons, and Mr. Bird exhibited groups of plants. In Mr. Laing's collection was a good plant of *Anthurium Waroquanum*, to which a First-class Certificate was awarded as a new foliage plant. Messrs. Laing & Hooper, of Bath, exhibited cut blooms of *Pansies*. The General Horticultural Company exhibited a noble group of *Dracenas*, comprising many fine forms, also a fine lot of well-marked *Gloxinias*. Mr. B. S. Williams had also a very fine group of new and other plants, four of which received First-class Certificates, viz., *Anthurium Waroquanum*, *Pteris internata*, *Croton Warrenii*, and *Nepenthes Williamsii*. Messrs. Laing received First-class Certificates for tuberous *Begonias* Mrs. Laing and J. S. Law; Mr. Miles, of Brighton, for a dwarf bedding scarlet *Pelargonium*, *West Brighton Gem*; Messrs. Jackson for Decorative *Pelargoniums* *Captain Beattie* and *Rosy Morn*; and Mr. J. Peed, Lower Norwood, for Fancy *Pelargonium* *Duchess of Connaught*. In the miscellaneous classes Mr. Cannell, of Swanley, showed a group of handsome *Coleuses* and baskets of bedding *Violas* covered with bloom.

**Edinburgh Botanical: May 13.**—The Society met in the class-room, Royal Botanic Garden; Mr. Gorrie, President, in the chair. The deaths of Miss Frances Hope, a Lady Associate, and of Professor N. I. Andersson, of Stockholm, a Foreign Member of the Society, were noted. The following communications were read:—

I. Microscopic Demonstration of the Fungus (*Saprolegnia ferax*) of the Salmon Disease, by Mr. A. B. Stirling, Assistant-Curator of the Anatomical Museum, University of Edinburgh: communicated by Professor Dickson. Several of the suite of specimens lately presented by Mr. Stirling to the museum of the Royal Botanic Garden were exhibited under the microscope,

and the mode of propagation of this fungus and the way in which Mr. Stirling holds that it destroys salmon and other fresh-water fish in our rivers demonstrated. Professor Dickson, in explanation, said that the *Saprolegnia* were closely allied in their general structure to such algae as *Vaucheria*. They consisted, like *Vaucheria*, of branching filaments, which, however, were continuously tubular, differing in that respect from the articulated filaments which occurred usually in fungi. Like *Vaucheria*, *Saprolegnia* was reproduced both sexually and non-sexually—in the latter process by zoospores, which, when set free, were capable of moving in the surrounding water. These zoospores were produced in enormous numbers, and must tend widely to disseminate the species.

II. Mr. Taylor exhibited about thirty specimens of dried plants from Mount Zombra, Central Africa. They had been collected there, as well as on the banks of streams and on altitudes of 7000 feet in the Shire highlands, by Mr. John Buchanan of the Church of Scotland Mission there. Professors Balfour and Dickson both complimented the zeal and perseverance of this solitary collector.

III. Note on a new method of drying plants on paraffinised paper. By Mr. John Galletly, chemist, Addiewell: communicated by Mr. Taylor.

IV. Report on temperatures, and on the progress of open-air vegetation at the Royal Botanic Garden. By Mr. Sadler.

V. Miscellaneous communications.

Amongst the exhibits was the shrub of *Aristololia racemosa*, twigs of which were shown by Dr. Cleghorn at last meeting, grown in the greenhouse of C. Cowan, Esq., Westerlea, Murrayfield: also a magnificent double-spathed *Anthurium Scherzerianum*, sent by Mr. Hugh Johnstone, of Messrs. Dickson & Sons; and a double-spathed *Richardia æthiopica*, sent by the Rev. Hugh Taylor, Humsheugh, Northumberland. Mr. J. Campbell, of Ledaig, Argyllshire, sent a number of flower sprays from his garden, two of which, *Eurybia argophylla* and *Escallonia macrantha*, though flourishing with him, had been killed by the severe weather of the east coast. Mr. Dunn, Dalkeith, showed a magnificent specimen of *Morchella esculenta*, gathered in his locality. Mr. S. Grieve sent fungi, taken two days previously, growing in darkness, in a cave 90 feet from the surface in the island of Colonsay. A donation to the museum from Mr. Thomson of Travancore was placed on the table, consisting of a handsome box made of Cocoa-nut Palm wood with a Jack-wood lid; on the table also were numerous hardy and herbaceous plants, many alpine, from the propagating department of the Royal Botanic Garden, including *Saxifraga MacNabiana*, *Darlingtonia californica*, *Primula sikkimensis*, *Primula pedemontana*, *Daphne striata*, and *Meconopsis aculeata*.

**Bath and West of England Agricultural: Worcester, June 2-7.**—The horticultural department of this great exhibition is as usual under the management of the Hon. and Rev. J. T. Boscawen, who, as heretofore, has succeeded in making up an effective exhibition, with the materials, good, bad, and indifferent, which he has been able to collect in the district. The most extensive contributors are Messrs. R. Smith & Co., who have sent from their world-famous nurseries at St. John's a large and varied assortment of plants and cut flowers. The former comprises a quantity of small pot Roses and *Rhododendrons*, well-flowered; some handsome specimen *Conifers* and Japanese *Maples*, as well as representatives of many other pictorial trees; and a great variety of herbaceous and alpine plants. These latter adorn a rockery arranged at one end of the tent. The next largest contributor is Earl Somers, Eastnor Castle (Mr. Coleman, gr.), to whom Mr. Boscawen is indebted for many large and well-grown fine-foliaged plants, which contribute most materially to the general effect. Mr. Coleman also shows a grand pair of plants of the white Paris Daisy, which measure a yard or more in diameter, and are a mass of blossoms. A capital collection of between fifty and sixty *Orchids* is shown by W. E. Brymer, Esq., Ilington House, Dorchester (Mr. Powell, gr.). In this group are to be seen *Epidendrum prismatocarpum*, with nine fine spikes; *E. vitellinum*, also fine; *Dendrobium Dalhousianum*, with a dozen or more spikes; a capital piece of *Masdevallia Harryana*, *Odontoglossum vexillarium*, with eight spikes, five to six flowers on each, &c. Sir William Marriott, Down House, Blandford (Mr. Denny, gr.), also contributes a choice collection of *Orchids*, which includes several good varieties of *Odontoglossum Alexandræ*, a fine specimen of *Oncidium macranthum*, *Cattleya labiata*, &c. With this group is also shown one of the finest flowered masses that we have seen of the *Orchid-like* *Utricularia montana*. A number of *Orchids* of an interesting character are also shown by H. C. Miles, Esq., Shirehampton (Mr. W. Perry, gr.); and Captain Dymond, Brooklands, Dorchester (Mr. Lye, gr.), exhibits *Odontoglossum citrosomum roseum*, with six magnificent spikes of flowers; also a finely grown *Aerides*, not named. A couple of large and well flowered *Brugmansias* and a few well grown *Alocasias* are,

with other things, shown by T. K. Hill, Esq. (Mr. B. Hughes, gr.); and some large masses of ornamental-leaved *Begonias* come with other objects from the gardens of E. Humphreys, Esq., Mount Pleasant, Pershore (Mr. E. Lott, gr.); and from H. Bramwell, Esq., Crown East Court (Mr. Helman, gr.), come *Zonal Pelargoniums* and *Mignonette*. Messrs. John Laing & Co., Forest Hill, contribute a group of one dozen varieties of their new tuberous-rooted *Begonias*, also cut blooms of a number of the best sorts. The finest stand of cut blooms of the old Fortune's Yellow Rose that we have seen for years is exhibited by J. H. Arkwright, Esq., Hampton Court, Leominster (Mr. Bye, gr.); and a stand of highly-coloured Tea Roses comes from W. J. Grant, Esq., Ledbury.

## Variorum.

THE BEAN VIELD.

'TWER where the zun did warn the lewth,  
An' win' did whiver in the sheade,  
The sweet-air'd leans were out in bloom,  
Down there 'tihin the Elem gleade;  
A yellow-banded bee did come,  
An' softly pitch, wi' bushen hum,  
Upon a Bean, an' there did sip,  
Upon a sway'en blossom's lip:  
An' there cried he, "Aye, I can see  
This blossom's all a-zent vor me."

A-jilted up an' down, astride  
Upon a lofty ho'se a-trot,  
The measter then come by wi' pride,  
To zee the Beans that he'd a-got;  
An' as he zot upon his ho'se,  
The ho'se agein did snort an' toss  
His high-ear'd head, an' at the zight  
Ov all the blossom, black an' white:  
"Ah! ah!" thought he, the seame's the bee,  
"Theese Beans be all a-zent vor me."

Barnes's Poems.

**TREE FERNS IN VICTORIA.**—A highly creditable display of Tree Ferns, says the *Melbourne Leader*, may be seen in the nursery of Mr. John C. Cole, of Richmond, and to this attaches all the more interest as the collection has existed there for a sufficient length of time to admit of comparisons of the rate of growth. *Cyathea Cunninghami*, of New Zealand, proved one of the quickest in growth, it having added about 4 feet to its stem in four years. The stem of *Cyathea Smithii* grew only about 1 foot during four years in Mr. Cole's collection; nor proved the growth of the stem of *C. dealbata* any faster. The stem of *Alsophila excelsa* added 2 feet to its length within the same period. *Alsophila Cooperi* was raised from spores four years ago, and its stem is now 1 foot over the ground. This rate of growth of different Fern trees would, of course, be subject to much variation in the ranges, according to soil and perhaps climate and situation. A very slender *Cyathea* of the Cape Otway ranges and Dandenong, to which Baron von Mueller has given the name *Cyathea Boylei*, in commemoration of Mr. David Boyle's discovery of this Fern tree in the Dandenong Ranges, grew also nearly 4 feet in four years. This rare species was formerly regarded as identical with *Cyathea affinis*, of the South Sea Islands, but a comparison of the fruiting fronds (which were obtained at last by Mr. Gesner) with original specimens of the genuine *C. affinis* and the Dandenong species, proves it specifically distinct. Indeed, it is very similar to *Cyathea Cunninghami* of New Zealand, in the slenderness of its stem, the colour of and persistency of the frond-stalks, scales, and some other respects, but Baron von Mueller, as well as Professor Kirk, of Wellington, regard the Victorian *Cyathea* distinct from *C. Cunninghami*, and the former gentleman intends to give early a fuller account of *C. Boylei*. It is easier still separated from *Cyathea Smithii* (which is really a *Hemitelia*) by its fruits, that of *C. Boylei* being much like *C. medullaris*, under which latter name this Tree Fern occurs in the *Flora Australiensis*.

**HARDY HERBACEOUS PLANTS AT KEW.**—*Hesperis violacea*, a very free-flowering dwarf Rocket, of neat pyramidal habit, is a showy and desirable border plant; its flowers are rather large, and of a pleasing pale violet colour. *Ionopsidium acaule*, a lovely miniature Crucifer, has dense cushions of small-stalked roundish leaves, studded with white blossoms; the genus is peculiar to the Mediterranean region, and this species, at least, is decidedly attractive, and well worth growing. Amongst the

Comfrets the handsomest at present are *Symphytum caucasicum*, a dwarf free-flowering species, with blossoms red in their young stage, changing to a pleasing blue as they get older. *S. bohemicum*, a plant only about a foot in height, with long narrow leaves and deep red flowers; and *S. ibericum*, a distinct-looking dwarf species, with glossy ovate-acuminate, long-stalked leaves and white blossoms. *Polygonum alpinum*, an old-fashioned perennial not frequently met with now, is attractive by reason of its branched lax panicles of white flowers. *Euphorbia palustris*, too, with its Willow-like, soft, light-green foliage and golden-yellow bracts, is a splendid plant for margins of shrubberies, &c.; it grows about 2 feet high. *Veronica pectinata*, an oriental species, forms a dense carpet of softly hairy, small-toothed leaves and racemes of ultramarine white-centred blossoms. *Valeriana tuberosa*, nearly a foot in height, bears compact heads of flesh-coloured flowers. A charming little perennial is the South European *Coronilla vaginalis*, with its profusion of yellow flowers; it does best on rockwork. *Genista prostrata*, a companion plant to the last, has flowers of the same colour, and thrives under the same conditions. *Potentilla heptaphylla*, about a foot in height, has a profusion of bright golden-yellow blossoms. A very floriferous plant, of easy culture, is *Claytonia sibirica*, which now is one mass of pale rose-coloured flowers. *Polemonium coeruleum* var. *grandiflorum* is, from a horticultural point of view, a much better plant than the common Jacob's Ladder; it attains a height of about 2 feet, and bears much larger blue flowers than the type. *Senecio spathulifolius*, about 6 inches high, has long woolly leaves and umbels of golden-yellow flower-heads. It would hardly be fair to pass over the lovely little *Arenaria balearica*, which on damp stones and well-drained soil forms a compact carpet of tiny leaves studded with innumerable starry white blossoms.

GERMAN GARDENERS IN ENGLAND.—We have heard from the fraternity in various quarters that the German element is becoming unpleasantly strong in English gardens and nurseries. To our knowledge the number of German gardeners who come to this country increases from year to year; but comparatively few of them take permanent situations, and those who obtain posts sufficiently good to induce them to remain in the country do so by their special qualifications. As a writer in our contemporary, the *Deutsche Gärtner-Zeitung*, observes, German gardeners travel more than those of any other country, and they make great sacrifices and undergo no little hardship to see what is to be seen abroad. Many of them are content to do labourer's work for a time in order to earn sufficient to keep body and soul together, and give them an opportunity of seeing something. But if there is any truth in the complaint that British gardeners are suffering from German competition, we have not far to seek the cause. Employers would not engage foreigners by preference without some corresponding advantage—this is certain. This advantage can only be more, or a higher class of work for less money than he would get from an Englishman. The remedy is clear. Nobody who knows anything of the subject will deny that the education of the average German gardener is far in advance of that of his English colleagues; and when he combines thorough practical knowledge with it, he naturally stands a good chance in competition. But in practical matters alone the English have no cause to fear competition. Frequently it is ignorance of foreign languages, especially of French and German, that defeats an Englishman in competition with a German for a post in a commercial house. From our insular position and the ever increasing spread of the English language only a very small portion of the English people are likely to become linguists. It is force of circumstance to a great extent that leads to the acquirement of a speaking knowledge of foreign languages. To learn a language without learning to speak it is very dry work, except perhaps to those who already understand two or three other languages. But, it may be asked, why do English gardeners not go to Germany and France and there learn the languages and what is new to them in practical gardening? The answer to this is—because it is very difficult for them to obtain employment in a country overflowing with labour. It is not a thirst after knowledge alone that impels many Germans to leave their home; it is oftener to find a better market for their talent. Now

with regard to the Indian Forest Department, many of the best posts are held by Germans, simply because qualified English foresters could not be found. It is true that some provision has been made to remedy this defect, but the Germans will always continue to be formidable rivals. In spite of the difficulties English gardeners, except a favoured few, have to encounter in acquiring a speaking knowledge of foreign languages, it is gratifying to be able to state that the number is increasing. Finally, we can only say, that so long as Englishmen do not qualify themselves for certain posts, they will fall to the lot of foreigners.

LORD BACON ON FORCING.—The learned author of the *Silva Sylvarum* has the following quaint account of "Experiments in consort touching the Acceleration of Germination":—"There were sown in a bed Turnip-seed, Radish-seed, Wheat, Cucumber-seed and Peas. The bed we call a hot-bed, and the manner of it is this—there was taken horse-dung, old and well-rotted; this was laid upon a bank half a foot high, and supported round with planks, and upon the top was cast sifted earth some two fingers deep, and then the seed sprinkled upon it, having been steeped all night in water mixed with cow-dung. The Turnip-seed and the Wheat came up half an inch above-ground within two days after without any watering; the rest the third day. The experiment was made in October, and (it may be) in the spring the acceleration would have been speedier. This is a noble experiment; for without this help they would have been four times as long in coming up. But there doth not occur to me, at this present, any use thereof, for profit; except it should be for sowing of Pease, which have their price very much increased by the early coming. It may be tried also with Cherries, Strawberries, and other fruit, which are dearest when they come early." The author goes on to explain in detail experiments on plants with various manures and other means of accelerating and retarding growth, concluding:—"The housing of plants (I conceive) will both accelerate germination and bring forth flowers and plants in the colder season. And as we house hot-country plants, as Lemons, Oranges, Myrtles, to save them, so we may house our own country plants to forward them and make them come in the cold season; in such sort that you may have Violets, Strawberries, Pease all winter; so that you sow or remove them at fit times."

Obituary.

WE greatly regret to have to announce the death of A. B. STEWART, Esq., of Ascog Hall, Bute. In him horticulture has lost one of its most enlightened and liberal patrons. Mr. Stewart, as we learn from the *Glasgow Herald*, though at the head of one of the most extensive mercantile concerns in the kingdom—that of Messrs. Stewart & M'Donald, Buchanan Street, Glasgow—the interests of which would have proved more than equal for the energies of the average business man, managed to seize ample opportunity to share in nearly all good and benevolent undertakings, and not only to share, but to initiate and carry to a successful issue others which aimed at the elevation of the habits and tastes of the community. And this noble work he applied himself to in no ostentatious manner, but in a quiet, and, as circumstances demanded, considerate but firm spirit, whose sole ambition was the achievement of the end in view, and whose only reward was the thought that something had been attempted, something done which would tend to make men—and women, too—better and happier than he had found them. Mr. Stewart always contended that there was no better way of getting at the heart of man than through flowers—which speak a language that the meanest understanding can comprehend—and he would frequently add that there was hope for the most depraved if once he could be induced to take an interest in even the tiniest and the least lovely of Nature's floral products. To make the exhibitions, therefore, which are regularly held under the auspices of the Glasgow Horticultural Society attractive and entertaining, the gardens of Rawcliffe Lodge were laid under constant contribution, and that with unstinted hand. Mr. Stewart was for many years President of the Society, and gave assistance and aid, which will be greatly missed by the directors and friends of the association. Closely allied with his love for horticulture was that for the advancement of

the Fine Arts in all their varied branches. There was no warmer friend and patron of all that was good in art. His picture gallery at Rawcliffe Lodge, one of the finest and largest in Scotland, bears testimony to this fact. Generally, it may be said that all philanthropic, educational, literary, and scientific projects met with his heartiest sympathy, and his interest was expressed, not in words merely, but in the kindest and most substantial, and therefore most appreciable manner.

— JEAN NUYTENS VERSCHAFFELT. — The announcement of the death of this distinguished and amiable horticulturist will be received with very great regret by his many friends and acquaintances in England. M. Nuytens Verschaeffelt was the adopted son of the late Jean Verschaeffelt, of whose nursery, near Ghent, he was the manager, and to which he succeeded on the death of the proprietor. M. Nuytens Verschaeffelt was deservedly a favourite for his genial straightforward character, while his nursery was one of the most remarkable, even in that town of nurseries, Ghent. The English visitor, go when he might, was sure to meet with a most kindly reception on the part of the proprietor, while the collections of plants under his care were unusually interesting and important. M. Nuytens Verschaeffelt died on the 30th ult., after a short but painful illness in the forty-fourth year of his age. M. Nuytens Verschaeffelt was an active member of the Royal Agricultural and Botanical Society of Ghent, a Chevalier of the Order of Philip the Magnanimous; but his best title to remembrance will be his own character.

The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON FOR THE WEEK ENDING WEDNESDAY, JUNE 2, 1880.

May 27.—Generally fine, though very cloudy and dull at times. Showery 4 to 5 P.M. Very cool at night.  
 — 28.—A fine day, though dull at times. Strong wind. Cool. Cloudless at night.  
 — 29.—A fine bright day, but frequently dull. Cool, Windy. Cloudless at night.  
 — 30.—Fine, with occasional sunshine, but generally dull. Overcast at night. Cool.  
 — 31.—Overcast, dull and wet till 5 P.M. Fine and bright at night. Cold day.  
 June 1.—Fine and bright till noon. Dull and showery after till 6 P.M., then fine. Windy. Cold.  
 — 2.—Generally dull, though fine at intervals during afternoon. Slight showers in morning. Cool.

LONDON: *Barometer*.—During the week ending Saturday, May 29, in the vicinity of London the reading of the barometer at the level of the sea increased from 29.86 inches at the beginning of the week to 30.10 inches by the morning of the 25th, decreased to 29.74 inches by the morning of the 27th, increased to 30.47 inches by the morning of the 29th, and was 30.44 inches at the end of the week. The mean value for the week at sea level was 30.06 inches, being 0.13 inch above the average, and 0.09 inch below that of the preceding week.

*Temperature*.—The highest temperatures of the air observed by day varied from 87½° on the 26th, 75° on the 25th, and 71½° on the 27th, to 60¾° on the 23d; the mean value for the week was 69¾°. The lowest temperatures of the air observed by night

varied from 40° on the 29th to 51° on the 24th; the mean value for the week was 47°. The mean daily range of temperature in the week was 22°, the greatest range in the day being 37°, on the 26th, and the least, 14°, on the 24th.

The mean daily temperatures of the air and the departures from their respective averages were as follows:—23d, 52°.5, - 1°.8; 24th, 56°.5, + 1°.9; 25th, 59°, + 4°; 26th, 66°.7, + 11°.5; 27th, 59°.7, + 4°.3; 28th, 52°.5, - 3°.1; 29th, 50°.5, - 5°.3. The mean temperature of the air for the week was 56°.8, being 1°.6 above the average of sixty years' observations.

The highest readings of a thermometer with blackened bulb in vacuo, placed in the sun's rays, were 169° on the 26th, 153° on the 25th, and 146° on the 27th; on the 23d the reading did not rise above 110°. The lowest readings of a thermometer on grass, with its bulb exposed to the sky, were 32° on the 19th, and 38° both on the 26th and 28th; the mean of the seven lowest readings was 40°.

Wind.—The direction of the wind was S.W., and its strength strong throughout.

The weather during the week was fine and bright, and very dry. On Wednesday the 26th the weather was exceptionally hot, and the maximum reading, 87°.2, was the highest recorded in the month of May during the forty years, 1841—1880.

Rain.—A little rain fell on the 27th, the amount measured was 0.03 inch.

ENGLAND: Temperature.—During the week ending Saturday, May 29, the highest temperatures of the air observed by day were 87° at Blackheath, 85° at Cambridge, 81° at Norwich, and 77° at Nottingham, and below 62° at both Liverpool and Bradford; the mean value from all stations was 71°. The lowest temperatures of the air observed by night were below 40° at Plymouth, Cambridge, Wolverhampton, Nottingham, and Sheffield; and above 44° at Bradford and Sunderland; the mean from all places was 40°. The extreme range of temperature in the week was above 41° at Blackheath, Cambridge, and Nottingham, and below 21° at Liverpool and Bradford; the mean range from all stations was 30°.

The mean of the seven high day temperatures was above 67° at Blackheath, Cambridge, Norwich and Nottingham, and below 60° at Wolverhampton, Sheffield, Liverpool and Bradford; the general mean from all stations was 63°. The mean of the seven low night temperatures was below 44° at Wolverhampton, Nottingham and Hull, and above 49° at Truro, Brighton and Sunderland; the mean value from all places was 47°. The mean daily range of temperature in the week was above 22° at Blackheath, Cambridge and Nottingham, and below 11° at Liverpool and Bradford; the mean daily range from all places was 16°.

The mean temperature of the air for the week from all stations was 53°, being 3° higher than the value for the corresponding week in 1879. The mean temperature was above 56° at Blackheath, Cambridge, and Norwich, and below 50° at both Wolverhampton and Liverpool.

Rain.—The amounts of rain measured during the week were large everywhere, except in the South of England. At Wolverhampton, Sheffield, Liverpool, Bradford, and Leeds 1½ inch fell, whilst at Brighton, London, Cambridge, and Norwich less than a quarter of an inch was measured; the average fall over the country was eight-tenths of an inch.

The weather during the week was generally fine and bright, with showers at times.

Slight thunderstorms occurred at some places on the 25th and 27th.

SCOTLAND: Temperature.—During the week ending Saturday, May 29, the highest temperatures of the air observed by day varied from 64° at Aberdeen to 58° at Greenock; the mean value from all places was 61°. The lowest temperatures of the air observed by night varied from 34° at Greenock to 41° at Leith; the general mean from all stations was 38°. The mean range of temperature in the week from all stations was 22°.

The mean temperature of the air for the week from all stations was 51°, being 2° higher than the value for the corresponding week in 1879. The highest was 52°, at Dundee, and the lowest 49°, at Greenock.

Rain.—The amounts of rain varied from 0.70 inch at Greenock, 0.63 inch at Aberdeen, and 0.59 inch at Paisley, to 0.05 inch at Dundee. The average fall over the country was 0.36 inch.

DUBLIN.—The highest temperature of the air was 61°, the lowest was 38°, the extreme range 23°, the mean 51°, and the fall of rain 0.23 inch.]

JAMES GLAISHER, F.R.S.

Enquiries.

He that questioneth much shall learn much.—Bacon.

SHADE TEMPERATURE.—What is the highest outdoor shade temperature recorded in England?

Answers to Correspondents.

A CORRECTION.—In our report of the last meeting of the Fruit Committee of the Royal Horticultural Society, it was stated that Ledsham's White Broccoli was considered by the Committee to be the same as Cattell's Eclipse. Subsequently an opportunity for comparison having been afforded, the two were found to be quite distinct. Ledsham's Late White is much whiter and closer in the head, with the leaves more closely protecting, than in Cattell's Eclipse.

APRICOTS: Constant Reader. These fruits may be successfully grown in a cool orchard-house, either in pots or trained after the manner of Peach trees.

ASH: A. V. Z. We could only see the traces left by the grub, not the grub itself.

CAPE EVERLASTING FLOWER: A. W. F. Helichrysum vestitum. See *Gardeners' Chronicle*, April 15, 1876, for an article on the subject.

ONIONS: S. B. Your plants are attacked by the grub of the Onion Fly (*Anthomya ceparum*, fig. 126), as

FIG. 126.—THE ONION FLY.

well as by that of the Brassy Onion Fly (*Eumerus ceneus*, fig. 127). Pull up the plants, and burn them;

FIG. 127.—THE BRASSY ONION FLY.

or, if you do not care to adopt so radical a measure, scatter soot thickly over the bed.

DISEASED POT VINES: C. We have received specimens from various quarters, all presenting the same general character. The young growth is checked, the leaves shrivelling up and dying. In one case before us the roots are in good health. There is no trace either of fungus or insect. We do not know fully the circumstances under which the plants have been grown, but the appearance is compatible with the idea that too strong a dose of manure has been applied, or at too early a period. The scorching sun we had some week or two since may also have caused the mischief.—H. J. C. Can you send us some roots? We see no trace of insect or fungus.

GLOXINIA: H. E. G. A fine strain, remarkable for size and substance. There is nothing very novel in the colour of the one sent.—Constant Subscriber. A very good strain of flowers, but not at all novel in colour or marking.—H. J. C. Two or three of the larger flowers are fine, and appear to us distinct, especially one with a rich plum-coloured throat, but the others are nothing beyond the average flowers of a good strain, which yours evidently is.

HARBY AZALEAS: R. P. Korr. A batch of large-flowered and showy kinds, but too much alike in colour—shades of pink and salmon-pink varying in intensity. They are good in their particular way, but lack variety, which is a very marked character of the Knapp Hill strain we have once or twice alluded to.

INSECTS: H. C. *Otiorynchus sulcatus*. Spread a sheet under the Vines at night, give the canes a sharp tap, and you will capture them easily.

NAMES OF PLANTS: Dr. Morton. *Cotoneaster microphylla*, *Veronica gentianoides*, probably; but you send no leaves.—W. P. *Saxifraga chryso-splenifolia*, round leaf; *S. geranioides*, *Erigeron philadelphicus*, purple; *E. bellidifolium*, white. Another time number your specimens.—D. P. 1, *Veronica gentianoides*; 2, *V. prostrata*; 3, *Nepeta Mussinii*; 5, send fruit as well as flowers; 6, *Geranium reflexum*; 7, *Polystichum angulare* var.—Norman Cookson. *Dendrobium secundum*.—W. B. *Brassia verrucosa*.—7, *P. Erinus alpinus*.—Camjee. The *Aquila*, which had fallen to pieces, appears to be *A. leptoceras*.—R. L. 1, *Lastrea quinqueangularis*; 2, *Pteris straminea*; 3, *Polystichum angulare*, var. *cristatum*; 4, *Gymnogramma tartarea*; 5, *Athyrium Filix-fœmina rhæticum*; 6, *Polystichum angulare*, var. *proliferum*.—G. W. B. *Adiantum decorum*.—H. H. D. Apparently a white-flowered variety of *Verbascum Blattaria*, but the blossoms were much faded.—Francis C. We cannot undertake to name more than six:—1, *Sedum Stoloniferum*; 5, *Sanguisorba officinalis*; 6, *Sedum asiaticum*; 7, *Sedum Rhodiola*; 8, *Alchemilla vulgaris*; 11, *Sedum anacampseros*; 12, *Alchemilla alpina*. The *Saxifraga* next week.—Correspondent (no name sent). *Coronilla Emerus*.

RARE PLANTS AT LLANDUDNO.—Mr. George Simpson writes in reply to Mr. Wolley Dod, whom he accuses of inaccuracies and misrepresentation, that he has lived at or near Llandudno for the last eighteen years. Mr. Simpson, moreover, asserts that the plant called *Claytonia sibirica* is wrongly so called, and that he himself in 1870 dug up on the Little Orme's Head an *Orchis hircina*, which he has also found in Kent and in Wiltshire. Mr. Simpson must be aware that mere assertion, however correct it may be, will not suffice to convince those conversant with British botany that *Orchis hircina* grows or grew wild on the Orme's Head.

VINE BORDER: H. Clerk. We would put in 9 inches in depth of loose stones. They will answer as well as bricks. It is not necessary to break them up small, like road metal. If you can cut some turf, lay it on the stones with the grass side underneath.

FOREIGN SUBSCRIBERS sending Post-office Orders are requested to make them payable at the post-office, King Street, Covent Garden, London, and at the same time to inform the Publisher at the office of this Journal.

CUT FLOWERS.—WHOLESALE PRICES.

Table listing various cut flowers and their wholesale prices in s. d. s. d. format, including Abutilon, Anemone, Arum Lilies, Azalea, Bouvardia, Calceolaria, Carnations, Cornflower, Eucharis, Forget-me-not, Gardenias, Heliotropes, Lily of the Valley, Mignonne, and Narcissus.

SEEDS.

LONDON: June 2.—The seed market to-day, as usual at this time of year, was thinly attended, and the amount of business doing extremely meagre. In fact the agricultural situation generally shows this week no alteration. An abundant and continuous downfall of warm genial rain is still greatly needed in all parts of the country. The crops of Tares, Trifolium, and Kye are described as almost total failures. Clovers and Trefoils are also very unpromising. In the absence of transactions, values on Mark Lane are without variation. Canary and Hemp seed are still exceedingly cheap. The trade for Mustard and Rape seed keeps firm. Blue boiling Peas are rapidly advancing in price; sound samples have now become exceedingly scarce, and the demand daily gets stronger. John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.

CORN.

There was not much life in the trade at Mark Lane on Monday. English Wheat was about the same in price as at the previous market, and quotations in the case of foreign showed no material variation from Monday's night; and the tendency was in favour of the consumer. Barley was quiet, on former terms; malt remained without change in price. Oats showed an improvement of about 3d. per quarter on the week, and Maize was slightly lower in price. Beans and Peas were steady at about late rates. In flour quotations had a drooping tendency all round.—On Wednesday trade was very quiet. Wheat, both English and foreign, was held for Monday's prices, but the tone was anything but strong. Barley moved off slowly on former terms, and malt was neglected. The Oat trade was not very good, and an easy tone prevailed as regards Maize. Beans and Peas were steady, and flour was dull and weak.—Average prices of corn for the week ending May 29:—Wheat, 44s. 11d.; Barley, 30s. 4d.; Oats, 25s. 1d. For the corresponding period last year:—Wheat, 41s. 5d.; Barley, 28s. 6d.; Oats, 21s. 11d.

CATTLE.

At Copenhagen Fields on Monday there was a shorter supply of beasts than on Monday's night, and choice English, being scarce, made higher rates. For some very choice Canadians trade was good. The sheep trade opened brisk, at fully late rates, but slackened towards the close. Choice lambs and calves sold about as of late, but middling qualities were difficult to dispose of. Quotations:—Beasts, 4s. 6d. to 5s. 2d., and 5s. 8d. to 6s. 4d.; calves, 5s. 6d. to 6s. 8d.; sheep, 5s. 2d. to 5s. 6d., and 6s. 4d. to 7s.; lambs, 7s. to 8s.; pigs, 4s. 6d. to 5s. 6d.—On Thursday the cattle trade, though quiet, was steady. Both beasts and sheep commanded full prices for choice descriptions, and lambs were rather better. Calves sold at the above rates.

HAY.

Tuesday's Whitechapel Market report states that there was a large supply, and dull trade at the following rates:—Prime Clover, 100s. to 132s.; inferior, 65s. to 95s.; prime meadow hay, 80s. to 105s.; inferior, 38s. to 70s.; and straw, 30s. to 39s. per load.—On Thursday there was a short supply of fodder on sale, and trade was very dull; prices were unaltered.—Cumberland Market quotations:—Superior meadow hay, 100s. to 110s.; inferior, 48s. to 76s.; superior Clover, 120s. to 132s.; inferior, 90s. to 105s.; and straw, 36s. to 40s. per load.

POTATOS.

The Borough and Spitalfields Markets reports state that supplies continue moderate, the demand steady, and prices are as follows:—Scotch Champions, 150s. to 160s. per ton; Lincolnshire ditto, 140s. to 160s.; Victorias, 150s. to 155s.; German reds, 4s. to 7s. per bag; and French whites, 4s. to 4s. 6d.—During last week 803 bags were received from Hamburg, 764 Stettin, 7666 packages Malta, 2443 packages 200 boxes Lisbon, and 5614 barrels from Cornwallis.

COALS.

The prices current at market during the week were as follows:—East Wylam, 15s.; Ryhope Hartley, 13s. 6d.; Walls End—Hetton, 14s. 6d.; Hetton Lyons, 13s.; Hawthorns, 13s. 3d.; Lambton, 13s. 6d., and 14s.; Original Hartlepool, 14s. 6d.; Wear, 13s.; South Hetton, 14s. 6d.; Tunstall, 13s.; Tees, 14s. 3d.

The following is an additional List of celebrated Nurserymen, Gardeners, and Market Growers who are using this Manure:—

- JOHN SMITH, Curator, Royal Gardens, Kew
A. F. BARRON, Superintendent, Royal Horticultural Gardens, Chiswick
W. COOMBER, Curator, Royal Botanic Gardens, Regent's Park
W. H. HEAD, Superintendent, Crystal Palace Gardens, Sydenham
JAMES VEITCH & SONS, Royal Exotic Nursery, Chelsea
E. G. HENDERSON & SON, Pine-apple Nursery, Maida Vale
B. S. WILLIAMS, Victoria and Paradise Nurseries, Holmwood
HUGH LOW & CO., Clapton Nursery, Clapton

**NEW PATENT GRASS-CUTTERS**  
(PATRONISED BY THE BOARD OF WORKS).

W. CLARK, 232, Oxford Street, London, W.,

Desires to call public attention to a Patent Grass-Cutter he has just invented for use in the Garden and Farm, based upon the principle of the well known "Clark's" Horse-clipping Machine, and which is, by its lightness of construction and rapidity of action, far preferable to the existing implements in use, and supplies a want long felt by every one who possesses a garden, namely, an instrument which will mow grass where inaccessible to the lawn mower, trim grass plot edges, clip Ivy and other creepers, also shrubs and trees, and keep in order Box borders and fancy Trees, &c.; all which this ingenious little instrument is capable of doing.

It is made in three sizes, to cut in breadth 8 inches, 12 inches, and 16 inches respectively; and is so easy in working, and at the same time so effective, that even ladies can work it without feeling fatigued, there being no occasion to stoop on account of the long wooden handles attached to the machine, and a greater quantity of work can be done in a given time than by any other method.

This invention is also applicable for Farm purposes—Reaping Corn and other Crops, Clover, Rye, &c., equally as well as accomplishing the objects for which it is required in the garden; and the cost being so small in proportion to the saving in time and quality of finish effected, it is placed within the reach of all, and needs but a trial to prove its superiority.

**RITCHIE'S GAS LIGHTING and HEATING APPARATUS.**

No Flue required. Specially adapted for Drying Newly-built Houses. Silver Medal awarded in 1878 at Wolverhampton Exhibition. The deleterious and unpleasant vapours arising from the burning of ordinary coal gas are prevented from escaping, and are made to circulate within the Apparatus or Stove in such a way that they become thoroughly condensed, and are carried off in the form of a liquid, in which will be found the sulphur and other poisons which are drawn from and would in the ordinary way be left in and mixed with the surrounding atmosphere; consequently health is not prejudicially affected, Works of Art, Plants, Pictures, Books, Furniture, &c., are not injured, and the atmosphere is rendered uncontaminated and perfectly healthy.  
 Prices from 50s. to £10 10s.

Full particulars and testimonials forwarded on application to **RITCHIE AND CO.**, 23, St. Swithin's Lane, London, E.C.

VINERIES, FRAMES,  
and all descriptions of Horticultural Buildings.

**HILL AND SMITH'S BLACK VARNISH**  
for Preserving Ironwork, Wood, or Stone.  
*(Registered Trade Mark.)*

This VARNISH is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the advertisers, and its genuine good quality, notwithstanding a host of unprincipled imitators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requires no mixing or thinning and is used cold. It is used in the grounds at Windsor Castle, Kew Gardens, and at the seats of many hundreds of the Nobility and Gentry, from whom the most flattering testimonials have been received.  
Sold in casks of about 30 gallons each, at 1s. 6d. per gallon at the Manufactory, or 1s. 8d. per gallon carriage paid to any Station in the Kingdom.

**UNSOLICITED TESTIMONIAL.**  
"Pierrefield Park, June 21, 1876.—Sirs,—I have this day forwarded from Chepstow to your address a black varnish cask, to be filled and returned with as good Varnish as the last we had, which I candidly admit was the best we ever had. Address Varnish to Pierrefield Park, Chepstow.—I am, Sirs, yours respectively, Wm. Cox."  
**CAUTION.**—HILL & SMITH would particularly warn their Customers against the various cheap Varnishes now so much advertised.  
H & S's Varnish has been an article of common use on most of the large estates in the kingdom for upwards of thirty years; and their constantly increasing trade in it, and the numerous Testimonials they receive, stamp it as a truly genuine article. Every cask is legibly marked with their name and Registered Trade Mark as above, without which none is genuine.  
Large Illustrated CATALOGUE of Fencing, Hurdles, Field and Entrance Gates, &c., sent free on application to  
**HILL AND SMITH, Brierley Hill Ironworks, Staffordshire;**  
118, Queen Victoria Street, London, E.C.; and 180, Buchanan Street, Glasgow.

ROSE GROWER.—Twenty-two years' experience. Good references.—J. WOOD, Stapleford, Salisbury, Wiltshire.

TO GARDENERS.—The Hon. and Rev. G. BOURKE is anxious to find a situation, in a Gentleman's Garden, under a good Gardener, for a respectable, intelligent, and trustworthy Boy, aged 13.—Address, The Rectory, Pulborough.

GARDENER'S LABOURER, and to make himself useful.—Middle-aged, active. No objection to the country.—C. S., 12, Portland Street, West Kensington, S.W.

To the Seed Trade.

SHOPMAN or MANAGER.—Age 32; seventeen years' experience in every department, London and provincial. Highest references.—HORTUS, 63, Carlisle Street, Belfast.

SHOPMAN, in a Seed and Florist's Shop; in or near London preferred.—Young; six years in last place.—X. V. Z., Day's Cottage, Ashford, Middlesex.

Nursery and Seed Trade.

SHOPMAN.—Thoroughly experienced in the Agricultural Seed Trade. Should have no objection to Assisting in Warehouse or Nurseries. Over seven years' experience.—J. C., Lea Road, Gainsborough, Lincolnshire.

TEN POUNDS will be given to any one procuring the undersigned a good situation. Long and first-class character from last employer, and can be highly recommended by others.—HORTUS, Mr. H. Baker, Albert Road, Tamworth.

DINNEFORD'S MAGNESIA.

The Medical Profession for over Forty Years have approved of this pure solution as the Best Remedy for ACIDITY OF THE STOMACH, HEARTBURN, HEADACHE, GOUT, AND INDIGESTION, and as the safest Aperient for Delicate Constitutions, Ladies, Children, and Infants.

DINNEFORD'S MAGNESIA.

WHISKERS

Send for a Bottle, as it is guaranteed to effect this marvellous change in a few weeks.

Never fails.

BEFORE USE. SAVILLE'S. AFTER USE. CAPILLARY GERMINATOR has been proved by hundreds to be the only real producer of Whiskers and Moustaches and Curer of Baldness.

PRESS OPINIONS.—"Decidedly the most efficacious and rapid in its operation of any preparation of the kind! A thoroughly reliable Hair Producer."—*London Press*. "Just what it professes to be—in effect."—*Irish Press*.

Of all Chemists and Perfumers. Sent to any address, carriage paid, free from observation, with testimonials, directions for use, &c., on receipt of 2s. 6d. Larger sizes, 4s., 8s., and 11s. Carriage paid, 1s. extra. JOHN F. SAVILLE AND SONS, 145, Regent's Park Road, London, N.W.

Important Caution! Beware!—Many persons are copying our title and advertisements. This is the original and only genuine "Capillary Germiator." Buy no other. Above title (registered) is moulded in every bottle.

WHAT PRODUCES HAIR?

"We are glad to be able to announce that an answer has been found to this long puzzling and perplexing of questions in Warde's Capillare, which, however, turns out not to be a 'new discovery,' but one that has been in use in the practice of a physician of eminence for many years... and so successfully as to produce many beautiful growths of hair, as also whiskers and moustaches in abundance. The secret of its preparation has been purchased by Messrs Warde & Co., and these gentlemen are giving to society at large what, until lately, has been confined to a limited circle—A REAL HAIR PRODUCER."—*Civil Service Gazette*.

A beautiful Head of Hair, Whiskers, Moustaches and Eyebrows positively produced by the use of

WARDE'S CAPILLARE

(The only "Comme il faut" Hair Producer).

(After a course of Warde's Capillare).

It preserves the natural colour of the hair; KEEPS IT FROM THINNING; IS A SPECIFIC FOR PREMATURE BALDNESS; and thoroughly eradicates scruff and dandriff. Its fragrance and purity, moreover, recommend it FOR DAILY USE, as the best dressing for the Capillature.

Not genuine without Warde & Co.'s signature on the label, thus *Warde & Co.*

Beware of those who copy the style of our Advertisements, and then "Caution" you that theirs have been so treated. Directions for use with each bottle.

Price, 2s. 6d. per bottle, three bottles 6s. 6d., Privately packed, carriage paid.

Can be obtained from all Chemists, per order on Wholesale Houses; or sent under cover, upon receipt of remittance, by G. WARDE & CO., 15, GE. MARLBRO' ST., LONDON, W.

KINAHAN'S LL WHISKY.

KINAHAN'S LL WHISKY.

Pure, Mild and Mellow, Delicious and Most Wholesome. Universally recommended by the Profession. The Cream of Old Irish Whiskies.

KINAHAN'S LL WHISKY.

Dr. Hassall says—"Soft and Mellow, Pure, well Matured, and of very excellent quality."

KINAHAN'S LL WHISKY.

Gold Medal, Paris Exhibition, 1875; Dublin Exhibition, 1865, the Gold Medal.—20, Great Titchfield Street, London, W.

EPPS'S COCOA.

GRATEFUL

AND

COMFORTING.

JAMES EPPS AND CO., HOMEOPATHIC CHEMISTS.

HOLLOWAY'S PILLS.—In general debility, mental depression, and nervous irritability there is no medicine which operates so like a charm as these famous Pills. They purify the blood, soothe and strengthen the nerves and system, give tone to the stomach, elevate the spirits, and, in fact, make the patient sensible of a total and most delightful revolution in his whole system. They may be commended most unreservedly as the very best family medicine in existence. Though so powerfully efficacious, they are singularly mild in their operation, and might be given with perfect confidence to delicate women and young children. They contain not a grain of mercury, or any other noxious substance, and cannot do harm. Delicate females and all persons of sedentary habits will find these Pills a blessing.

# GREEN'S PATENT "SILENS MESSOR" & "MONARCH"

NOISELESS LAWN-MOWING, ROLLING AND COLLECTING MACHINES FOR 1880.

THE WINNERS OF EVERY PRIZE IN ALL CASES OF COMPETITION.

Patronised by Her Most Gracious Majesty the Queen on many occasions, H.R.H. the Prince of Wales, the King of the Belgians, the late Emperor of the French, the Emperor of Russia, and most of the Nobility, Clergy, and Gentry of the United Kingdom.

Upwards of 95,000 of these Machines have been Sold since they were first introduced in the year 1856,

And Hundreds of unsolicited Testimonials have been received testifying to their superiority over all others.

They have been submitted to numerous practical tests in Public Competition, and in all cases have carried off every Prize that has been given.

The following are the advantages over all others :—

- 1st. Simplicity of Construction—every part being easily accessible. 2d. They are worked with much greater ease than any other. 3d. They are the least liable to get out of order. 4th. They make little or no noise in working. 5th. They will cut either long or short Grass, wet or dry.

## Single-handed Lawn Mower.

To cut 6 inches ... ..	Price £1 15 0
Can be worked by a Lady.	
To cut 8 inches ... ..	2 10 0
Can be worked by a Lady.

Can be worked by a strong Youth.	
To cut 12 inches ... ..	4 10 0
Can be worked by a Man.	
To cut 14 inches ... ..	5 10 0
Can be worked by a Man.	

## Double-handed Lawn Mower.

To cut 16 inches ... ..	Price £6 10 0
This can be worked by One Man on an even lawn.	
To cut 18 inches ... ..	7 10 0
By a Man and Boy.	
To cut 20 inches ... ..	8 0 0
By a Man and Boy.	
* To cut 22 inches. By Two Men ...	8 10 0
* If made stronger, suitable for Donkey, 30s. extra.	
* To cut 24 inches. By Two Men ...	9 0 0
* If made stronger, suitable for Donkey, 30s. extra.	

Prices of Donkey, Pony, and Horse Machines, including Patent Self or Side Delivery Box, Cross-stay complete, suitable for attaching to Ordinary Chaise Traces or Gig Harness :—

### DONKEY and PONY MACHINES.

To cut 26 inches ... ..	£14 0 0
To cut 28 inches ... ..	16 0 0
To cut 30 inches ... ..	18 0 0
Leather Boots for Donkey ... ..	1 0 0
Leather Boots for Pony ... ..	1 4 0

### HORSE MACHINES.

To cut 30 inches ... ..	£22 0 0
To cut 36 inches ... ..	26 0 0
To cut 42 inches ... ..	30 0 0
To cut 48 inches ... ..	34 0 0
Leather Boots for Horse ... ..	1 9 0

The 26 and 28 inches can easily be worked by a Donkey, the 30 inches by a Pony, and the larger sizes by a Horse; and as the Machines make little noise in working, the most spirited animal can be employed without fear of its running away, or in any way damaging the Machine.

Delivered, Carriage Free, at all the principal Railway Stations and Shipping Ports in England, Scotland, and Ireland.

No Lawn Mower Manufacturer keeps so large a stock of Mowers as is to be found at our London Establishment, 54 and 55, Blackfriars Road, where purchasers can select out of several hundred Machines, of Hand, Pony, and Horse Power, and have their Orders executed the same day they are received.

The above Machines are Warranted to give entire Satisfaction, otherwise they may be returned AT ONCE, free of cost to the Purchaser.

N.B.—Those who have Lawn Mowers which require repairing should send them to either our Leeds or London Establishment, where they will have prompt attention, as an Efficient Staff of Workmen is kept at both places.

## GREEN'S PATENT ROLLERS

For Lawns, Drives, Bowling Greens, Cricket Fields and Gravel Paths.

SUITABLE FOR HAND OR HORSE POWER.

These Rollers are made in two parts, and are free in revolving on the axis, which affords greater facility for turning. The outer edges are rounded off, or turned inwards, so that the unsightly marks left by other Rollers are avoided.

Diam. Length	£ s. d.	Diam. Length	£ s. d.

# HUGH LOW AND CO.

Have pleasure in informing their Friends and the Public that their

**STOCK OF ORCHIDS IS VERY EXTENSIVE,**  
and well worth the notice of intending Purchasers, who are cordially invited to an Inspection of the Plants.

At the Clapton Nursery Orchids are grown in Eleven Houses, one of which is 155 ft. in length and 30 ft. in width.

Mr. BOXALL has recently returned, bringing with him, in cases measuring over 30 tons, the fine Collection of PHALÆNOPSIS made during his stay in the Philippine Islands.

Eleven Span-roofed Houses, of an aggregate length of 976 feet, have been added to the Glass Structures of the Nursery, to meet the increasing demand for Ornamental and Flowering Plants.

## CLAPTON NURSERY, LONDON, E.

This variety belongs to the viticella type, and is remarkably richly coloured." First-class Certificate Royal Horticultural Society. Price 15s. each.  
**LILACINA FLORIBUNDA** (T. Cripps & Son).—Pale grey-lilac, deeply veined; flowers the size of C. Jackmanni, but having six petals and of perfect shape. This is the lightest variety and most abundant bloomer in this section. An admirable contrast to C. Jackmanni for bedding purposes. Price 10s. 6d. each.  
**OTHELLO** (T. Cripps & Son).—Flowers medium, a good shaped six-petaled variety. Late and very free flowering; colour dark velvety purple. Price 10s. 6d.  
Discount to the Trade.  
Plates of "Earl Beaconsfield" and "Lilacina grandiflora," 2s. 6d. each.

The Tunbridge Wells Nurseries, Kent.

### MATRICARIA INODORA PLENA

(NEW DOUBLE MAY-WEED).  
Figured in *Gardener's Chronicle* of December 13, 1879.  
Will bear the severest winter without protection. If grown in a rich border it will flower in the greatest profusion from June till October, and the flowers, which are pure white, are equal to those of a Pompon Chrysanthemum. It is invaluable for cutting. 1s. 6d. each, 12s. per dozen, 75s. per 100. Engraving sent with three plants. The usual discount to the Trade.—  
Messrs. DICKSONS and CO., 1, Waterloo Place, Edinburgh.

#### Vines—Vines—Vines.

**JOHN COWAN**, The Vineyard and Nurseries, Garston, near Liverpool, has still on hand a fine Stock of Fruiting and Planting CANES of Muscat of Alexandria, Bowdow Muscat, Mrs. Pince, Gros Guillaume, Burchard's Prince, and Madresfield Court. Also Planting Canes of several other varieties. CATALOGUE free. The Trade supplied.

#### Illustrated Catalogue of Ferns.

**W. and J. BIRKENHEAD**, Fern Nursery, Sale, near Manchester, beg to say that their CATALOGUE of FERNs for 1880 is now ready, consisting of eighty-four pages, containing many Illustrations, Synonyms, Descriptions, and copious yet simple "Hints on Fern Cultivation," post-free for six penny stamps. Also, now ready, a "SPECIAL LIST of FERNs," free on application.

#### Primulas—Primulas—Primulas.

Eleventh Year of Distribution.  
**WILLIAMS' superb strain**, 1s. 6d. per dozen, 10s. per 100; package and carriage free.  
**CINERARIAS**, choicest assortment, same size and price.  
The above are quite equal to those I have sent out in previous years. Cash with order.  
**JOHN STEVENS**, The Nurseries, Coventry.

### GARDEN REQUISITES.

**COCOA-NUT FIBRE REFUSE**, 3d. per bushel; 100 for 20s.; truck (loose, 250 bushels), 20s.; 4-bushel bags, 4d. each.

#### Weeds Eradicated from Lawns.

**WATSON'S LAWN SAND** both destroys Daisies, Plantains, Rib-grass, &c., and invigorates the grass. Testimonials and instructions on application. 36s. per cwt.; 56 lb. kegs, 19s.; 28 lb. tins, 10s.  
Proprietor, **W. D. BARBOUR**, 3, Park Row, Leeds.

#### Tobacco Fibre Insecticide.

All who have a Greenhouse and love to see their Plants look clean and healthy should use

**DARLINGTON BROTHERS' TOBACCO FIBRE**.—Contains more Nicotine than any other Insecticide sold; purer and better than the best Tobacco Paper or Cloth; easy to use; no apparatus requisite; a common garden pot only required; will not flare, is perfectly safe, and is the best article for making Nicotine Juice for syringing purposes. Forty per Cent. saved by the use of this article. Prices, 6 lb., 5s.; 28 lb., 21s. First-class ROLL TOBACCO PAPER or CLOTH, same price as above. Best Paper and Cloth made. *Wide Testimonials*, free on application. Post-office Orders, Darlington Brothers, Chatham. Cheques crossed London and Provincial Bank.  
**DARLINGTON BROTHERS**, Frederick Street, Chatham.

**GISHURST COMPOUND**.—Used by many of the leading Gardeners since 1859, against Red Spider, Mildew, Thrips, Greenfly, and other Blight, in solutions of from 1 to 2 ounces to the gallon of soft water, and of from 4 to 16 ounces as a winter dressing for Vines and Fruit Trees. Has outlived many preparations intended to supersede it. Sold Retail by Seedsmen in Boxes, 1s., 3s., and 10s. 6d. Wholesale by PRICE'S PATENT CANDLE COMPANY (Limited).

**FOR SALE**, a Quantity of Old TOBACCO ROPE, suitable for Greenhouse Purposes. Will be sold cheaply. Apply, **JAMES LAMKIN and CO.**, Limited, 9, Patrick Street, Cork.

#### To Strawberry Growers.

**THE STRAW BOTTLE PACKINGS** are being used as a thick pad, for placing under Ripening Fruit, being an effectual Preservative against Slugs and Dirt. Wheat Straw, 7s.; or Rye Straw, 5s. 6d. per gross.  
**SEYMER and CO.**, 37, Eastcheap, London, E.C.

### ANDERSON'S RUSSIA MATS

For COVERING, TYING, and PACKING, are highly recommended for durability and cheapness. Descriptive Catalogue sent post-free on application. And by Special Warrant to  
HIS ROYAL HIGHNESS THE PRINCE OF WALES,  
**READING.**

**IMPORTANT NOTICE.**

**J. CHAMBERS,**  
Westlake Nursery, Isleworth, W.  
Is now prepared to send out his two new Hybrid Bulbus BEGONIAS, ROYAL STANDARD and AVALANCHE, in nice healthy little plants at 15s. each. They received First-class Certificates, June, 1879, both at South Kensington and Richmond. These are undoubtedly the two grandest Hybrid Begonias ever offered: see *Gardener's Chronicle*, June 28, 1879. Both varieties can be seen in flower at the nursery.  
Also a new White LOBELIA MAGNIFICA ALBA. The habit is identical with that well-known variety magnifica. As a pot plant for general decoration with Lycopodium, Maidenhair, and other small Ferns, I know of nothing to equal it. Nice plants at 15s. 6d. each, or 12s. per dozen.  
Usual allowance to the Trade. Terms cash. Post-office Orders payable at Spring Grove, Isleworth, W.

**CAULIFLOWER AND CABBAGE PLANTS.**

Our own selected stocks, in good strong plants Veitch's Autumn Giant Cauliflower, per 1000, 7s. 6d.; Walcheren and Early London Cauliflower, per 1000, 6s.; Brussels Sprouts, per 1000, 5s.; Daniel's Defiance Cabbage, per 100, 1s., per 1000, 7s. 6d.; Enfield Market, Early Nonpareil, and other sorts, per 1000, 5s.; Champion Drumhead or Cattle Cabbage, extra fine stock, per 1000, 4s. 6d.  
Free on Rail at prices quoted. Orders of 20s. and upwards carriage free.

**DANIELS BROTHERS,**

The Royal Norfolk Seed Establishment, Norwich.

**TEA SCENTED ROSES,**  
For Planting Out or Greenhouse Culture.

Upwards of 20,000 strong, well established plants, in pots.

*List and Prices on application to*

**CRANSTON'S NURSERY & SEED COMPANY, Limited,**  
KING'S ACRE, near HEREFORD.

To the Trade,

HOME-GROWN TURNIP SEEDS.

**H. AND F. SHARPE** invite the attention of the Trade to their fine selected Stocks of TURNIP SEEDS, which comprise, amongst others, the following excellent varieties, viz:—  
Sharpe's Improved Large Swede Sutton's Mammoth Purple-top  
Sharpe's West Norfolk Swede Devonshire Grey Stone  
Sutton's Champion Swede Pomeranian White Globe  
East Lothian Swede Lincolnshire Red Round  
Green-top Yellow Aberdeen Stratton Green Round  
Golden Yellow Aberdeen White Stone or Stubble  
The quality is very fine, and the prices will be found very advantageous to purchasers. For further particulars apply to Seed Growing Establishment, Wisbech.

*By Permission of the Hon. Board of Customs.*

(Free of Duty.)

**CORRY & SOPER'S**  
**NICOTINE**  
**SOAP**

(PATENT.)

An effectual and speedy Eradicator of  
**Scale, Thrips, Green Fly, Mealy Bug,**  
**Red Spider, American Blight,**  
and all  
**Parasites affecting Plants, without**  
**Injury to Foliage.**

*It may be used with perfect safety and efficiency for the Destruction of Gooseberry Caterpillars.*

Especially adapted for the Destruction of Blight on the Coffee Plant.

The Proprietors have great pleasure in bringing to the notice of Horticulturists generally this valuable preparation, the basis of which is *Nicotine*, or the Oil of Tobacco, with which is blended other essential ingredients, to render it available as a general INSECTICIDE.

It has now undergone a thorough test by some of the most Practical Men in Horticulture, and it is proved beyond all doubt that no Insecticide will bear comparison to it for killing properties with PERFECT SAFETY TO FOLIAGE.

It may be used as a Dip or Wash for any description of Out or Indoor Plants, and as a Dressing for the Bark of Fruit Trees, Vines, &c., it has no equal.

Some hundreds of Testimonials lately received from men of considerable experience throughout the Kingdom.

Sold in Jars, 8 oz., price 1s. 6d.; 20 oz., price 3s.; and in Tins, 14 lb., price 15s. 6d.; and Drums, 28 lb., price 25s.; 56 lb., price 50s.; 112 lb., 95s. Full directions for use on each package.

And 2 ounce Sample Jars, 6d. each.

Full directions for use on each package.

Manufacturers of TOBACCO POWDER, TOBACCO JUICE (duty free), TOBACCO PAPER and CLOTH, and HORTICULTURAL SUNDRIESMEN.

May be obtained from all Seedsmen and Florists.

Wholesale from the Manufacturers,

(Limited), King's Acre, Hereford.

New Crotons.

**IRELAND AND THOMSON** have much pleasure in introducing the following superb additions to this splendid tribe of decorative plants:—

**CROTON INTERRUPTUM AUREUM.**—This is a most distinct and elegant variety. It is a seedling raised at their Craigleith Nursery, originating in a cross between *C. interruptum* and *C. Johannis*. It resembles the former most in the form of its foliage, which is interrupted, but being more slender is even more elegant, arching gracefully outwards without the spiral form which characterises that parent. The colour is the deep golden tint of *Johannis* on a dark olive-green ground colour, the gold predominating. It branches most freely naturally without stopping. For table decoration it is without exception the most elegant and beautiful Croton in cultivation, and is certain to become a favourite exhibition variety. It was awarded a First-class Certificate at the Liverpool Horticultural Association's Show in August, 1879, and was also awarded the same distinction by the Scottish Horticultural Association at the last meeting of its Committee on New Flowers. Price 10s. 6d. each. Terms to the Trade on application.

**CROTON DUKE OF BUCLEUCH.**—Among all the trilobate forms this splendid variety stands pre-eminent for the size and the depth of colouring of its foliage. The origin of the variety is a cross between *Disraeli* and *Johannis*, the former being the seed-bearing parent. It has the form of the foliage of *Disraeli*, with greater size and boldness, thus adapting it admirably for bold specimen plants. The colour is that of *Johannis* with a deeper tint of gold in the mature leaves, the younger leaves being marbled and suffused with gold and deep olive-green. It was awarded a First-class Certificate at the Royal Horticultural Society's Show at Preston in 1878, also at Edinburgh in 1879. Price 10s. 6d. each.

Terms to the Trade on application.

Nurseries, Craigleith, Comely Bank, and Royal Exotic, Lynedoch Place; Seed Warehouse, 20, Waterloo Place, Edinburgh.

**New Coleus, Petunias, and Fuchsias of 1879 and 1880.**

**THE EXECUTORS OF H. WALTON** beg to offer the following NEW COLEUS of 1880:—*Duchess of Teck*, Empress of Germany, James Barnshaw, Juno, Lovely, Royal Purple, and Sensation, 1s. each. New Varieties of 1879:—*Aurora*, Butterfly, Firefly, Glow, Magic, and Sparkler, 8d. each, strong, well rooted plants; the thirteen varieties, 10s.

New Double Fringed PETUNIAS of 1880. These have been selected with great care from an extensive collection, and can be confidently recommended as being a great advance on anything hitherto offered. Strong, well-rooted plants, 2s. 6d. each, 24s. per dozen varieties, post-free.

New Double Fringed PETUNIAS of 1879, 1s. each, 9s. per dozen varieties.

New FUCHSIAS, 1879 and 1878, very choice sorts, 9d. each, all post-free, for cash with order.

A fine collection of BEGONIAS, Tuberos-rooted and Ornamental-leaved, Half Specimen ERICAS, &c., the best exhibition varieties.

For descriptions of the above see CATALOGUE, sent post-free, on application.

VICTORIA AND PARADISE NURSERIES, UPPER HOLLOWAY, LONDON, N.

THE

Gardeners' Chronicle.

SATURDAY, JUNE 12, 1880.

MR. DAY'S ORCHIDS.

CHIEF among those Orchid collections in and around London, or indeed over the country, that have stood the test for the last twenty years, is that of John Day, Esq., at Tottenham. Many, very many, during that time have been formed, and have been dispersed. The few that rank alongside or take precedence of it could be counted on the fingers of one hand, and those few, looking to the ambition and enterprise of some of the Orchidophilists of the present day, are wanting in importance. The collection at Tottenham, however, year by year increases in interest and value, comprising as it does nearly all that is worth having, new and old. It was a grand collection when I knew and visited it first, nearly twenty years ago—about the time when *Odontoglossum Pescatorei* was only to be had in units instead of by thousands as now, when *Alexandrae* was unknown. Of course, the original species, *crispum*, had found its way to the Horticultural Society, and been named by the late Dr. Lindley, but to the best of my knowledge not a single plant of that importation survived. Mr. Bateman pointed out to me the residue of the importation—pseudobulbs all shrivelled and lifeless—and talked eloquently over the grandeur of the species, at that time unknown to culturists—and certainly, as the sequel has shown, not in too glowing language. These days, however—and it does not appear a very long time to look back upon—were the days when cool Orchid culture was not only at a discount, but was altogether ignored or misunderstood; hence the plants sent here from the alpine regions of tropical and semitropical climates were forced to succumb to unnatural treatment. The bringing them overland, in a hot, desiccating climate, to the seaport towns, was a severe enough punishment, and the correcting process of establishing them at home, or such of them as survived, as then practised, only ended in absolute loss. A better state of things has prevailed, and now cool Orchid culture seems to be better understood generally, looking to results, than any other kind of Orchid culture by whatever name it may be designated. To have a grand collection in these times, such as was to be seen at Mr. Day's, Mr. Rucker's, Mr. Warner's, and others which might be named, may seem to some preposterous in the light of our knowledge now; but it is not so. Attention was then given to many species of the East Indian and West Indian Orchids that are partly laid on the shelf in many modern collections—it may be because of the excessive heat and moisture in which they live and enjoy life, or because of the inability to cope with their cultural requirements; it cannot be for want of intrinsic beauty or wonderful detail in the matter of form and colouring. I know nothing modern to equal the grand arching racemes of the *Saccolabiums* and *Aerides*, the stiff and withal graceful spikes of *Vandas*, the marvellous branching panicles

of the white Moth Orchid (*Phalenopsis*), which veritably has no rival, and which I have from time to time seen grand in the collection under review; and yet I have the courage to speak in presence of the marvellous white *Odontoglots* that now form covets in all collections of importance—the more modern *O. vexillarium* and *Roetzlii*, &c. No doubt some species are useful for one purpose, some for another, but at best we weary of seeing the same kind of thing time after time. The great craving has been, is, and will be, for something new; but I do not know a single collection where so many species and varieties, both new and old, may be seen as at Mr. Day's.

To proceed, then, to particularise, I cannot pretend, looking to the time and space it would occupy, to do more than comment in a general way on the many plants that passed before the eye in going the round of the houses at Tottenham. Taking them in the order they were visited, the cool-house is of the usual form, placed in a north exposure, and is about 60 feet long, with path up the centre and the table platforms on either side. There was a good general display of *Odontoglots*, none of which shone out in the distance, and as you neared it became more enchanting, than *O. nœvium majus*. There were several plants of this, but one bearing seven arching racemes was in full efflorescence. The multitudinous spotting of this flower, and the intensity of the spots, which are nearer crimson than most other spotted Orchid flowers which get the credit of it, are on a clear white ground, and when in condition, such as the plant in question was, compel one to pause and examine it as one would do a fine painting. Not far from it was a tiny beauty of the liliputian order, also in bloom; I refer to *Odontoglossum blandum*. The segments of this are much like *O. nœvium* in colour and in spotting, but are nodding inwards, and then the labellum is twice the breadth of that of *nœvium*, and has comparatively large purplish spots or blotches—an exceedingly attractive and somewhat rare species to see in bloom. Like every other place where Orchids are grown *O. Alexandræ* was in abundance and in excellent order, some beautiful crisped varieties being in flower. Some very fine *O. Andersonianum* were here splendidly grown, and one extra variety with a panicle of fifteen flowers finely marked and the blooms of extra form. *O. odoratum* was here also in flower, and scenting the house with its Hawthorn-like perfume, the reddish spots on the pale yellow ground contrasting well with its congeners. *O. Pescatorei* was in particularly fine condition, the pseudobulbs roundish ovate, and of that fine dark colour which is so pleasing for a culturist to look upon. Some fine examples of *Hallii*, also *radiatum*, *luteo-purpureum*, *gloriosum*, *paradinum*, &c., were growing exuberantly, as also was *cirrosium* in some very rich claret-spotted varieties. Along with these *Odontoglots* were some well-grown examples of *Oncidium curtum*, *macranthum*, and many others; as also very fine examples of that grotesque but highly interesting Orchid, *Nanodes Medusæ*. This plant seems to like an airy temperature accompanied with a good deal of moisture.

Adjoining this is the *Cattleya*-house, 50 feet long, with a centre table and the usual side tables—a very comfortable house, not too lofty and ample means provided for ventilation. There are some well grown specimens here, great masses of *Lælia purpurata* in several varieties, fine *Boothiana* (*Cattleya lobata*), great *anceps*, and some of the earliest imported of *Lælia elegans* in quite first-rate condition, as also *Lælia Dormanniana*, a rather striking species, not unlike *bicolor* in both colour and formation, but the lobes of the lip folded back towards the base and running out towards the extremity, not unlike the "lappels" of a frock-coat. *Cattleya crispa*, too, was prominent, and among the more recent introductions, *Trianae*, *Warszewiczii* in its many forms, *C. Mendellii*, *gigas*, all in good condition; some very good plants of *maxima*, with its pale noble-looking flowers ornamented with radiating purplish lines, some of the varieties much more distinguished-looking than others; together with *exoniensis* and some other of the Veitchian hybrids. Troops of others filled the space in crowds; while suspended were quantities of *Lælia Dayana*, *Cattleya Regnelli*, *Schilleriana*, *bulbosa*, and many others.

In the other 50-foot division were some excellent *Vandas*, which I am glad to see as species looking

up again. When in first-rate cultivation there are few nobler looking plants, and the flowers are redolent of sweetness. *Vanda suavis* in several forms as also *V. tricolor*, in point of variety of ground-colour and spotting more variable still, were doing excellently, many of them clothed with leaves to the bottom, and quite 4 feet high, branching, not flaccid-looking things, but having a lustiness about them indicative of getting proper treatment, and a consequent large show of bloom; *Saccolabium*, too, of the *guttatum* and *Blumei* type, were going along fairly well, although I have seen them much finer in the Dayan collection. *Aerides* in numerous species filled the stages, and were showing well. Without a good batch of these handsome-looking distichous plants the centre stage of an East Indian-house looks bald. On the side stage were some of the dwarfier growing species along with those "fair plants" which do well in company and in a climate of this kind—*Zygotopetalum maxillare*, for instance, which now seems to move along fairly well and reward growers with plenteousness of bloom. *Dendrochilum filiforme*, too, a charming subject with its drooping racemes of flowers, like a design of fine lacework; the exquisite *Odontoglossum Roetzlii*, which evidently likes the warmth of this climate more than any one of its compeer *Odontoglots*, and if kept from the ravages of thrips is undoubtedly the queen of that section for general appearance. *Oncidium ampliatum majus*, too, more a plant for show and glare than for general usefulness. *Cypripedium* in plenty, *Dendrobium densiflorum* in quantities, particularly noticeable being one with a distinct white margin round its luxurious-looking labellum, and quite a host of very well managed *D. Cambridgeanum* full of flowers. This plant is not generally well under hand, but Mr. Day tells me he grows comparatively cold, and after resting the plants during the winter months takes them into this climate, where they set buds freely and flower as I saw them profusely.

Down the steps we emerge into a house of a lean-to stamp, where considerable head-room is required for tall plants, and among others we note finely grown *Vanda Lowii*, gigantic *Vanda Batemanni*, which have each yielded their great flower racemes—the one like a whip, so to speak, with its dimorphic flowers, first yellow-ground, then cinnamon; the other like a rod for a camel's back, both excellent species, but not often cultivated as they might be, chiefly, it is to be presumed, from the want of accommodation. Associated with them in temperature to suit their wants were the North American *Dendrobes*, *superbiens* doing well. The "toad-stool" looking *Bolbophyllum Beccarii* always arrests attention, what it will turn out to be in the way of a flowering subject is yet to be seen; it seems to like a warm climate. *Dendrobium taurinum*, one of the best coloured of its race, is a shy doer—the tall growing one was well in hand here—it seems rapidly disappearing out of the country.

Passing through the door, we are ushered into the *Phalenopsis*-house, which is about 50 feet long, and excellently fitted both for commanding heat and giving off moisture, and is only high enough to admit walking with your hat off. Such a climate is a splendid one for *Angraecums*, *Cypripediums*, and some other miscellaneous species. There is a grand lot of *Phalenopsis*, comprising almost, if not all, species alive in this country, comparatively free from spot. Judging from past experience, I should say, it is almost impossible to keep all these growing satisfactorily year by year; and the grower labours under this difficulty, that he can rarely increase them by division, consequently we have had to draw steadily from a native habitat to keep up the supply. Mr. Gedney seems to have these well in hand, in the meantime the blossoms of the hundreds of plants in this house must be quite a sight. The *Angraecums* are in splendid condition, comprising *sesquipedale* in several plants, *Chaillanum*, *Ellisii*, *pertusum*, the elegant *citratum*; splendid masses of *Cypripedium levigatum*, *Stonci*, unique as a cultivated plant, and its variety *platytenium*, which is as rare among *Stonci* as *Aerides Schroderii* is among *maculosum*; *Argus*, *Swannianum*, *Lawrenceanum*, *Dayanum*, and, not least in point of rarity, *Spicerianum*, are conspicuous. I have not seen for years so fine a batch of *Cattleya Aclandiae*, which is tied to blocks and suspended to the gable of the house—in this way Mr. Day reports that it grows and flowers quite satisfactorily every year. This, indeed, is a most interesting house, and it takes a long time to inspect it satisfactorily.

Passing out of the principal range we come to a set

of low span-roofed houses with path up the centre for various species. The first is a cool-house, measuring, as they all do, about 30 by 9 feet. There are quantities of the popular *Odontoglots* and numerous examples of *citrosium* in fine condition, grown much colder than one usually finds it, showing there is no royal road to culture. As companions to it were groups of *Rossii* and even *Oncidium crispum*, and the charming *Lælia anceps Dawsoni*, which certainly bears more cold to grow it well than any of the forms of *anceps* I have seen, and it was abundantly evident from the state of Mr. Day's plants that they were in the proper climate—a warm *Odontoglossum*-house. Here, too, was the rare *O. gracillimum*, fine pieces of *Cattleya maxima*, the spider-flowered *Oncidium phymatophilum*, in better style than we have seen it for years; *Oncidium Barkeri*, and many others.

The second house of this group was set apart for *Masdevallias*—for collection of species unique. I do not know another one, either personally or by reputation which contains so many species, unless it be that of M. A. de Branteghem, at Constantinople. To name them all would be merely the repetition of a catalogue. Mr. Day evidently grows them colder in winter than most amateurs. Along with them were *Lycaste Skinneri* and *alba*, and, what surprised me much, such a grand lot of imported *Cattleya Mendellii*, with great pseudobulbs and sheaths that might be equalled but certainly could not be excelled. How long they may remain in this climate in the same first-rate condition is a question to which experience only can furnish a proper reply. *Cœlogyne barbata*, too, was fine, and so was a group of *Pleurothallis*, of which *P. Dayana* and *scapha* were the most prominent.

The third house was filled with *Odontoglossum vexillarium* and other species, including the best grown lot of *Cymbidium eburneum* which is possibly to be seen in this or any other country. There are about a couple of hundred plants, and they will each bear individual inspection and criticism, which is saying much. *Lælia cinnabarina* seemed at home in this intermediate-house, and so were *Cymbidium Lowianum*, *Oncidium fuscatum*, and another group of *Cattleya Mendellii*.

In the other house were some plants of *Eriopsis biloba* of very high cultivation. The great difficulty with this spiny-rooted *Eriopsis* is to maintain its young roots intact. It is apt to go off suddenly, and once suffering in this way, like many other Orchids, it lessens in bulk every year. It has a singular succulent appearance, but when in flower it readily rewards those who grow it well; the combination of crimson and yellow and chocolate in the individual flower commands attention, and where you have a raceme—as seen during my visit—of twenty-six flowers, the effect on lovers of Orchid flowers can be easily understood. There are quantities of *Dendrobes* establishing themselves after the fatigue of the journey from their native home, none evidently doing better in their way than *Parishii* and *Bensoniæ*—both species that are well thought of, and not by any means free growers.

The responsibility of gardeners, and especially of those having charge of Orchid collections, is on the increase every year, and Mr. Gedney has a task every day before him of no ordinary importance, in keeping intact such a vast number of plants in a comparatively small space within the immediate influence of all that is inimical to plant life of the greatest commercial city in the world; and yet Orchids grow—and can be grown satisfactorily, too—although in the dark days of winter the duration of their bloom may be considerably affected. *James Anderson, Meadowbank Nurseries, Glasgow.*

## New Garden Plants.

MASDEVALLIA MILITARIS, *Rehb. f., Wsw.*

That set of scarlet, purple, or rose *Masdevallias* with short tubes and wide limb contains a number of species, while contrasted with them stands *Masdevallia rosea*, Lindl., with a wide tube equal in length to the wide limb. A scarcely known species of the first set was published as early as 1854 (*Bouplandia*, ii., 115!). It was called, from its flowers reminding one of English soldiers' jackets, *Masdevallia militaris*; and the next critical species is *Masdevallia ignea*, with its dazzling flowers. It is very easily recognised by its exceedingly stiff, dark green leaf of great substance, standing on a petiole shorter than the blade, by a thicker peduncle, a much wider flower-tube and a wider limb,

the first yellow, the limb cinnabarin, now partly yellow. The lip is much broader and shorter. The plant does not flower very readily, while *M. ignea*, with its much broader and longer, lighter green, thinner, long-stalked leaves, and much less-wide flowers, gives a profusion of bloom. It was originally discovered by late V. Warszewicz, my excellent friend, and Dr. Lindley had the flowers glued on the same paper with his typical *Maslevallia coccinea*, Linden! (Linden, André). The Warszewiczian plants arrived dead with the exception of a few remainders, which Mr. S. Rucker obtained, I believe: the flowers now to hand are descendants from those relics. Messrs. Veitch were so kind as to supply me four (!) years ago with specimens and their observations upon them. Since the plant was not represented by many specimens and was an especial pet of the possessors, an exceptional procrastination of decision might be permitted. I have just now obtained the same thing from Sir Trevor Lawrence and from the garden of Baroness Rothschild, at Gunnersbury, grown by Mr. Roberts, through Messrs. Veitch. *H. G. Rehb. f.*

VANDA PARISHII (*Rehb. f.*) MARIOTTIANA, *n. var.*

A very unexpected, glorious surprise, though we have already had some very curious cases of Vandas giving such an unusual variety of colours, that it might not be unreasonable to look out for a scarlet *Vanda cœrulea*.

Mr. Arthur Veitch, staying the other day with Sir William Marriott, a most enthusiastic Orchidist, was quite astonished by the sight of a *Vanda Parishii* bearing flowers of such a colour as neither he, nor the discoverer of the species, Rev. C. S. P. Parish, had seen before. The sepals have outside well-developed white keels, and on a light mauve ground numerous darker mauve blotches. The petals are quite mauve. Inside all those organs are totally mauve. The auricles of the lip are white with longitudinal mauve stripes and two yellow blotches under the bent column. Median partition of lip strongest lake-carmine. Column white with some purple. It is highly curious that when fading the blooms take on an olive-green tint with deeper blotches, thus finally looking like the genuine plant. The mauve colour is as warm as in the finest variety of *Phalenopsis Luddeemanniana*. *H. G. Rehb. f.*

VANDA LAMELLATA (*Lin. fl.*) BOXALLII, *n. var.*

This is a far superior variety to the common well-known species, that has been imported rather often, though apparently never in masses. It was only after careful dissection and assiduous comparison I dared pronounce it a lamellate, so distinct does it look by extent of flowers and colours. Yet we learn every day how many varieties in colour are to be found just as in Vandas, where we may see sky-blue represented by scarlet, a rather unique case, in Orchids at least. It has racemes of fourteen to twenty-four flowers, which are much longer than the leaves, nearly twice as long as those of the genuine species. They are ochre-coloured with purple base, blotches with a little hue of mauve, of greatest dimensions upon the lateral sepals; top of column, and lip's blade, purple-lake. It may be expected to be a very beautiful plant. I gave, indeed, the colours from Mr. Boxall's coloured sketch. It was he who discovered it in the Philippines, and sent it to Mr. S. Low. It is much to this gentleman's credit that he accepted for the sale my name, when every one who is initiated in the mysteries of Stevens' Rooms knows the plant would have fetched much more as a new *Vanda*. Ah, the words "new," "new species," help a good deal.

If Mr. Boxall was so lucky to meet with such a differently coloured variety, how would it be, if most accidentally he had a similar success as to *Phalenopsis*? *H. G. Rehb. f.*

DENDROBIUM CAPILLIPES (*Rehb. f.*) ELEGANS, *n. var.*

This is much taller than was the original plant as I saw it at Mr. Low's, and as it was drawn by its excellent discoverer, the Rev. C. S. P. Parish. The flower is as large as that one of *D. dixanthum*, and of the nicest yellow, dark orange at the base of the great lip. The stems reach 5 to 6 inches in height, and the oblique scars of fallen sheaths or leaves are black, when the surface of the articuli is covered with very numerous small grooves. From the young breaks the leaves would appear to have almost linear blades. This is a quite recent Burmese introduction. Two nicely dried flowers, collected by Mr. Richard Curnow, and two living plants, were kindly sent by Mr. S. Low, my oldest English Orchidic correspondent. A very minute examination of the materials persuaded me that it was really capillipes. It bears also that surprising nearly conico-pyramidal anther. I have also in my herbarium a very aberrant specimen of what I regard as the same thing. It flowered at Mr. W. W. Buller's, who then was a most enthusiastic Orchidist. It has very short pale red bulbs. I never saw any other like this. *H. G. Rehb. f.*

## THE OLEANDER.

THE interesting collection of varieties of this fine old plant—a subject far too much neglected in these days—which Mr. Farron has flowered at Chiswick, and produced at the meetings of the Royal Horticultural Society, has special claims on the attention of plant cultivators. It is nearly 300 years since the Rose Bay, as it is termed, was introduced to this country, and after becoming a leading subject in gardens, it has been put on one side, as "a relic of bygone days," in order to give place to plants that were the fashion of the hour.

The Oleander has been represented in English gardens for several years past by several varieties. The group at Chiswick includes some fifty varieties, representing the labours of Continental horticulturists, and it is with pleasure testimony is borne to the large amount of success which has attended their labours. The new varieties, so far as they have bloomed, are mainly single, and a few semi-double; the flowers are large and well-formed; and size being also present and united to freedom, the blooms are conspicuous and highly attractive.

The most brilliant coloured variety is one named Lattes, which has large and well-formed crimson-magenta flowers, remarkably attractive in colour. This cannot fail to make a highly valuable plant for the decoration of the conservatory and greenhouse. Next in depth of colour comes Notaire Cavallier, rich lake flushed with magenta, looking much like a small *Dipladenia*, and of excellent form. This and the foregoing will no doubt be much grown when better known. Frederic Guilbert has very large flowers, which are of a fine lively pink colour; a thoroughly fine variety. Delphine is of a pale magenta hue paling to pink, the flowers large and not of such good form as some of the others, but yet fine and useful. Pauline Gregoire is also pink-flowered, of a clear deep pink hue; very free indeed and most attractive. Rose Claire is pink, but the segments are distinctly flaked with ruby-rose, distinct and free. Rose Foncé has flowers of fine shape and size, rich pink in colour, with the segments edged and flaked with rosy-red; very fine and distinct, and perhaps the best of the pale pink varieties. Acrostial is of a very delicate pink colour, but the flowers being inclined to cup are not displayed to the best advantage. Rose Clair is a pretty pale pink variety, and very free of bloom. De Claude Sabut is a kind of hose-in-hose variety, clear pale pink in colour, the segments margined with ruby-red.

The white varieties are not the least attractive among them, the best being Madoni grandiflora, with clear white hose-in-hose, or semi-double flowers, large and very free and fine. Blanc Simple is quite single, and very pure in colour. Lastly comes Madame Dubois, also white; but the flowers are much curled on the segments.

The plants average from 2 to 3 feet in height, and appears to have been raised from layers. They were received from France in small pots—the soil in which they are growing being a stiff loam, apparently without any admixture whatever; and yet, confined as the roots must of necessity be, the plants have made a good growth and had excellent heads of bloom. The moral to be drawn from this is, that the Oleander should not be over-potted, rather its roots should be restricted to space, and their well-ripened wood will put forth heads of bloom of a valuable character. Plenty of water is necessary to the plants while growing and flowering; and after they have done blooming the wood must be well ripened. The best place to flower them is in a temperate-house.

One who has been successful in flowering the Oleander reports that, after blooming, the plants are placed in the open air, and watered when necessary. In October they are placed in an out-building, warm enough in winter to preserve Fuchsias and such-like things from harm from frost, and during the winter and up to early in March they should be watered only just enough to keep the plants alive. Then the plants are thoroughly saturated with water about the roots, in order to get a ball of earth and mass of roots thoroughly saturated, after which the plants are repotted into 24-sized pots, nothing being used but pure forest loam, and up to the time of blooming the pots are set in pans of water, and the plants kept in the warmest and lightest parts of the greenhouse, with the tops pretty near the glass. The plants grow very rapidly; the pots are quickly filled with roots, which overflow

and cover the surface of the pots also. The flowers begin to expand in June, are very large, and of a good depth of colour, the specimens remaining in flower for two months or more, and are beautiful and attractive objects. When the plant goes out of flower the flower-stems are cut away, and the plants set out-of-doors till October.

There are some parts of the world in which the Oleander is seen to great advantage. At Sydney and in its vicinity it grows in great luxuriance, attaining the height of 15 to 20 feet, and when covered with its elegant clusters of rose-coloured blossom it forms a magnificent ornament to the garden and shrubberies. A writer speaks of having seen a variety at Cairo on which the flowers were of a pure white colour, and the tree 8 to 10 feet in height.

It is stated that the Oleander "is a deadly poison, and may frequently prove a treacherous fondling if not carefully watched. It is one of our most beautiful window plants when covered with its large Rose-like blossoms, but in these blossoms the weapon of death resides." A case is recorded of a child having eaten a few flowers and being poisoned by the same. *The Annals of the Peninsular War* states that "a number of French soldiers went out foraging near Madrid, returned laden with the fruits of their search. One of the number, with a view of securing some wood to make skewers for the meat, cut a quantity of Oleander boughs, and, having stripped them of the bark, used the wood in the meat. The result was, that out of twelve who ate of the roast seven died, and the rest were dangerously ill. The poisonous principle is so subtle that its exhalations alone are sufficient to cause serious accidents, and even death, to those who recline or sleep for any time under their influence. It exists equally in every part of the plant, but it is considerably weakened by cultivation." *A. D.*

## EVERGREENS AT BORROWASH.

It would be impossible to point to any place where the lesson taught during the past winter to planters and all who take an interest in evergreen trees and shrubs is more complete and important than in the above nursery, and this for several reasons, the first of which is that quantities are grown of all the evergreen trees and shrubs which have been introduced during the last forty years; and the second that the locality is such as to thoroughly test their ability to stand our severest winters, the frost during the past winter having been more intense in the neighbourhood than in almost any other part of England. Consequently a short notice of such things as have been killed or injured, and also of those which have withstood the extreme cold, will be instructive. It may be here stated that the cold registered at the Elvaston Nursery was 40° of frost, or 8° below zero, which, coming as it did after a summer when there was so little solar warmth to solidify the soft and excessive growth that plants of all kinds made through the extreme moisture, rendered everything at all liable to suffer from a low temperature in the worst possible condition to bear it.

Commencing with *Araucaria imbricata*, some have almost escaped, whilst some large specimens, 15 to 18 feet high, as well as smaller examples, are killed or severely injured. The Silver Firs (*Piceas*) of this favourite family all appear to have come out unscathed, except the beautiful Californian species, *P. Parsonii*, some of which that had attained a height of 12 or 14 feet are all but killed, and others standing near them are not much injured. Some plants of *P. Pinapo* have lost their leaves on the ends of the shoots, but beyond this are no worse; others are not touched, showing the difference in ability to bear cold in different examples of the same plants under conditions precisely similar. *Arbutus cupressoides*, the jointed Vew, from Tasmania, and *A. selaginoides* Donniana, have both suffered so severely that they may be set down as dead. Some of the plants had reached a height of 10 feet, and have not been touched by frost before. *Abies Douglasii*: the green form much cut, but the glaucous variety is not touched. The Japanese *Abies firma* has also suffered much, but does not appear to be past recovery. *Cryptomeria elegans* is not much injured, whilst *C. japonica* is very brown. All large plants of *Acuba* are killed down to the ground, the smaller ones have escaped. *Euonymus* generally are either killed completely down, or much injured. Hollies have suffered severely; a few are killed outright, but

the greater portion have the wood not much injured, escaping with more or less loss of leaf. The large-leaved varieties, such as *I. Hodginsii*, are more injured than the smaller leaved sorts; *I. maderensis* and *I. maderensis atro-virens* have stood the best of the green kinds; *I. laurifolia nova* is one of the best and most effective of the green varieties, it has very large long leaves, and unusually large berries: the variegated sorts, taking them as a whole, have not suffered so much as the green ones. This about completes the return of killed and maimed, which collectively are a much more serious loss than the simple details given convey an impression of.

It is a much more pleasing task to turn to the quantities of fine things which have completely withstood the unusual ordeal through which they have passed; the more so, as many of them have not before been exposed to near so low temperature as occurred last December. To begin with the beautiful Japanese Spruce, *Abies Alcockiana* (*i.e.* *ajapensis*), which is evidently as hardy as an Oak, is as fresh and untouched in every way as if it had never been exposed to a single degree of frost. This plant is quite distinct from *A. acicularis* (the true Alcockiana), the under side of the leaves being silvery, whilst the leaves of the latter are green, it also starts into growth later; in ability to bear cold there appears to be no difference between the two. *A. polita*, another Japanese Spruce, of which it would be difficult to speak too highly for its distinct and handsome appearance, is equally as hardy as those previously named. *A. Parryana glauca* (*syn.* with *A. Englemanni*) has not so much as a leaf injured; this handsome glaucous-leaved plant is deserving of a place everywhere where evergreen trees are cultivated. *A. Pattoniana* has stood just as well as the above mentioned; it is much darker in the foliage than *A. Hookeriana*. This last is also uninjured. A fine young specimen here, 9 feet high, is as fresh in foliage as if it was the end of summer in place of spring succeeding such a winter. All the green forms of the Lawson Cypress are untouched, some of the coloured-leaved varieties are a little browned. *C. Lawsoniana lutea*, one of the finest of all the golden-leaved sorts, has stood bravely, as also *C. Lawsoniana gracillima*. The handsome dwarf-growing Californian Pine, *Pinus Bolanderi*, something like *P. insignis*, is not harmed in the least. The graceful-habited *Thuyopsis Stanjishii*, from Japan, is quite green and unaffected. The very distinct *Sciadopitys verticillata*, the Japanese Umbrella Pine, is perfectly frost-proof, an 8-foot specimen here has not a leaf browned. *Pinus parviflora*, a very beautiful small-growing Pine, is not the least injured. How much more suitable this and other similarly compact-habited species of evergreen trees that do not attain a great size would be for the numbers of places of limited extent than the large-growing kinds so often introduced to situations where in a few years they get too big for the place. The *Biotas* have stood well generally, *B. orientalis elegantissima* is unscathed. The beautiful free-growing *Picea* or *Abies Veitchii* (= *homolepis* or *brachyphylla*?) is not injured in the least, and it may now be looked upon as quite safe from our severest winters. All the *Retinosporas* have passed through the winter with next to no injury. The largest plant of *R. plumosa aurea* here is now 10 feet high by 7 feet through, a dense mass, finely coloured; *R. pisifera* has grown to 14 feet in height and 8 feet in diameter. *Thuyopsis dolabrata*, one of the best and most distinct of all the Japanese evergreens, is not the least hurt. The *Cephalotaxus* also have stood quite uninjured.

Whether or not variegation is a disease, or its presence an evidence of a weakened condition, as some attempt to make out, it is clear, by the way in which many have withstood last December's frost, that the variegated or coloured forms of plants are quite as able to bear extreme cold as are the green types from which they have sported or been raised from seed, as instance both *Hollies* and *Yews* at the Elvaston Nurseries, where the numerous seedlings with variegated leaves have all stood, as also the Elvaston golden variety, *Taxus baccata elvastonensis*, which having its leaves wholly of a yellow hue, might be supposed to have been less able to bear an extremely low temperature than the green type, yet it has come out unharmed. Mr. Barron's favourite seedling, *Taxus baccata Barroni*, is quite as impervious to frost as the green kinds: it is much superior to the ordinary variegated variety, being a much quicker grower, forming a leader without

any training. Some of the largest examples are beautiful plants. Some of the seedling varieties raised from the common Irish Yew, crossed with the golden sort, are very handsome, retaining the erect habit and hardiness, and being beautifully variegated. *T. laevis*.

## WEeping TREES.

IN this class are embraced the most charming examples of ornamental trees. Graceful in outline, elegant and novel in their mode of growth, impressive and attractive in appearance, they possess all those characteristics of growth and foliage which render them especially desirable and valuable for the embellishment of landscapes and the ornamentation of grounds. The beautiful cut-leaved Weeping Birch, sometimes called the Lady Birch, with its bright bark glistening in the summer's sun and its graceful drooping branches swaying in the lightest breeze, is a worthy subject for the artist's pencil and the poet's pen. In winter, too, covered with ice and illumined with the brilliant rays of the setting sun, its trembling branches apparently studded with innumerable brilliants, it presents a charming picture, attracting the attention and winning the admiration of even the most careless and indifferent observer. Henry W. Sargent, Esq., writing to the *Horticulturist* from Germany in 1848, and describing Booth's nursery at Holstein, stated that "among trees and shrubs new to me I noticed a Weeping Birch peculiar to Germany. It had descending shoots 32 feet long. The branches hung as perpendicularly downward as those of the *Sophora pendula* or the common Weeping Willow, and are quite as pensile as the latter."

The *Cut-leaved Birch* is one of those trees which is complete in itself. It has no defect in habit which requires to be concealed, and should always be planted by itself in the most prominent and conspicuous position on the lawn. Although it is a rapid grower, and attains to considerable size, it is equally well adapted for large and small grounds, and wherever planted always contributes towards rendering a landscape charming and effective. For avenue planting it surpasses all other trees. I have in my mind an avenue which has been planted lately in our city, and I trust the time is not far distant when we shall have several. Were we limited to a single ornamental tree, we should have no hesitation in selecting this in preference to any other. It is the most graceful of all trees, and deserves to be better known and more widely disseminated.

*Young's Weeping Birch* is a new and interesting variety, which is admirably adapted for the lawn. It was discovered about twenty years ago by Mr. Young, of Milford Nursery, Godalming. Owing to the slenderness of the branches, which, in the original plant were so weak as to creep along the surface, great difficulty was experienced in propagating it. To the graceful elegance peculiar to the Birch family it adds the odd singular erratic habit of the Weeping Beech. It has long, slender, thread-like branchlets, which fall from the main branches like spray. Grafted upon stems 6 to 7 feet high, it can be grown into a rounded, regular head, like the Kilmarnock Willow, or, left to itself, it will send up a leading shoot, with side branches like the cut-leaved, only more spreading. In this distinct type we have gracefulness and picturesqueness combined. It is one of the very best of new trees, and worthy of being introduced into every garden.

*Betula alba pendula elegans* is another charming variety, of quite recent introduction, and, as yet, but little known. It originated with the Messrs. Bonamy Bros., at Toulouse, France, in the year 1806, and was first exhibited by them at the Paris Universal Exhibition in 1807, where it received a Gold Medal, the highest award for new trees. Its habit of growth is unique and beautiful. Grafted on stems 6 to 8 feet high, the branches grow directly downwards, parallel with the stem. Its decided pendulous habit, rich, handsome foliage, delicate branches, render it particularly showy and attractive on the lawn. Among ornamental trees of recent introduction this and *Young's Weeping* may be considered the most valuable acquisitions of many years.

The *Kilmarnock Weeping Willow* is now so well known as to need no description. Being one of the most popular and widely-disseminated of weeping trees, its history may not be uninteresting. It was discovered growing wild in a sequestered corner of Monkwood estate, near Ayr, in Scotland, by an aged botanist named John Smith, an enthusiastic lover of

plants and a zealous collector. From him, Mr. Lang, a nurseryman at Kilmarnock, purchased one plant in the year 1844.

Sir W. J. Hooker, Curator of Kew Gardens, received two plants in the spring of 1852, and having observed how exceedingly ornamental it was, gave Mr. Lang a decided opinion, stating that he thought very highly of it, and that it was much admired in the Royal garden at Kew. The name, Kilmarnock Weeping Willow, was given to distinguish it from the common Weeping Willow and the American Weeping Willow. Of all weeping trees, it is the one best adapted for small lawns, garden plots or yards. Very handsome plants may now be obtained, grafted on stems 6 to 8 feet high, for training into umbrella heads. Grafted low, say 3 to 4 feet high, with the head nicely kept and the branches trailing on the ground, it becomes a novel and interesting object on the lawn. For rounding off or completing the end of a belt or border of trees or shrubs, it is very appropriate.

The *Weeping Beech* is undoubtedly one of the most remarkable of drooping trees. Its habit of growth is odd and eccentric, but at the same time picturesque and beautiful. A strong grower, its branches shoot upward, then outward, twist in various directions, and turn into a variety of shapes, then droop and trail on the ground. Divested of its leaves, it is quite ungainly; but clothed with its rich, luxuriant foliage, it presents a magnificent appearance. It is one of the largest and most curious of lawn trees, and should be planted by itself, where it can have abundance of room. Large specimens often cover an area 100 feet in diameter. Its history is somewhat remarkable. Some sixty years ago Baron de Man's gardener, at Beersal, Belgium, was planting an avenue of Beeches. The Baron, while superintending the work, noticed among the trees selected for the purpose one poor and crooked specimen, and rejected it; the gardener thinking, however, that it possessed some merit, planted it in a corner of the garden, where it grew to be one of the most beautiful of trees. One of the noblest specimens I have seen was in Mr. Anthony Waterer's nurseries, at Woking, England.

The *New American or Fountain Willow* is a well-known pendulous variety, which forms a very handsome specimen when budded standard high. While it can be trained in umbrella form like the Kilmarnock Willow, it is a much stronger grower, and requires more space. On account of its vigorous growth, it is much more difficult to keep in shape than the Kilmarnock, and, all things considered, hardly equal to that variety for ornamental planting. It is a trailing species of American Willow, grafted standard high, and was introduced from France about the year 1852.

The *European Weeping Ash* is a well-known weeping tree of vigorous habit, its branches spreading, at first horizontally, but gradually drooping towards the ground. Its strong, stiff growth does not render it as graceful and ornamental as many of the trees of this class, but planted singly on a large lawn it forms an interesting object. It is one of the best trees for forming an arbor.

The *White-leaved Weeping Linden* is a handsome drooping variety, with large round leaves, of a greyish-green colour above, and silvery-grey beneath. Worked upon stocks standard high, the branches shoot out almost horizontally, and as they increase in length bend gracefully towards the ground, giving to the tree a decidedly pendulous character. Being a strong grower it requires to be vigorously pruned to keep in shape. In this way it can be trained into a round symmetrical head, and will always be found a desirable addition to any collection, on account of its distinct silvery foliage, which contrasts effectively with the deep green of other trees.

Of *Weeping Elms* there are several which deserve attention. Our American Elm is one of the most noble and stately of weeping trees. It is so well known, that any notice of it here would be superfluous, but it may be proper to remark that it is not admissible on small lawns.

The most popular of Weeping Elms is the *Camperdown*, a very picturesque and elegant tree, which can be employed with the most satisfactory results in extensive grounds, as well as in small garden plots. It is of rank growth, the shoots often making a zigzag growth outward and downward of several feet in a single season. The leaves are large, dark green and glossy, and cover the tree with a luxuriant mass of verdure. By a judicious use of the knife it can be kept very regular and symmetrical in form, and

handsome specimen, isolated on the lawn, will always arrest attention and elicit admiration.

*The Scotch Weeping Elm* (*montana pendula*) is a drooping variety, resembling the Camperdown, but not so good.

*The Rough-leaved Weeping Elm* (*rugosa pendula*) is a pendulous variety with large rough leaves, and *Elm viminalis* is a distinct slender-branched variety, very ornamental in habit and foliage.

*The Weeping Mountain Ash* has probably received as much attention as any weeping tree, on account of its distinct and curious habit. A careful examination of its mode of growth cannot fail to excite wonder. If worked 2 or 3 feet from the ground and allowed to grow wild, it soon becomes as odd a piece of framework as it is possible to imagine. I have an indis-

*de St. Julien*, two varieties recently introduced from France, are almost similar to the above.

Probably the most remarkable and beautiful tree in this class, and one which is very little known or mentioned, is Bujot's Weeping Honey Locust. It has every characteristic of habit and foliage to commend it, but in severe winters it is liable to injury from frost. Its propagation is somewhat difficult, which will always make it expensive and rare. Like the weeping Japan Sophora, it sometimes succeeds in sheltered positions. I know of only one specimen in this vicinity which has survived the severity of several winters, unprotected. Those who love and admire fine trees, sufficiently to give them the necessary protection, will feel themselves amply repaid for any trouble or expense they may

belts or borders. In the hands of the skilful planter they are capable of producing the most charming results, and are more effective in giving character and expression to a landscape than any other trees. I append a list of select varieties for large and small grounds:—

*Select Drooping Trees for Small Grounds.*

Kilmarnock Weeping Willow	Weeping Larch
Young's Weeping Birch	American Weeping Willow
Cut leaved Weeping Birch	Camperdown Weeping Elm
Dwarf Weeping Cherry	Birch elegans pendula

To the above may be added:—

*For Extensive Grounds.*

Ash European Weeping	Elm, Scotch Weeping
Beech, Weeping	Linden, Weeping
Birch, European Weeping	Weeping Poplar
Birch, tristis	Weeping Cherry
Elm, Cork-barked Weeping	Mountain Ash, Weeping

*From an Essay by Wm. C. Barry, Rochester, N. Y.*

FIG. 128.—DRACENA "REGINA," HORT. BULL. (SEE P. 759.)

tingent recollection of one I saw growing in this manner, and at the time I considered it as great curiosity as I had ever seen. Grafted 6 to 8 feet high, it becomes a very desirable lawn tree, and in the autumn, laden with large clusters of bright red fruit, it produces a brilliant effect.

*The Weeping Poplar* (*Populus grandidentata pendula*), although not so elegant and graceful as some of the drooping trees we have mentioned, has many desirable qualities which commend it to the admirers of fine trees. Its character is decidedly pendulous, and its branches spread and droop gracefully towards the ground. But the knife must be used unsparingly to preserve the symmetry. It is the most rapid grower of any in this class, and those who desire a weeper which will produce immediate effect will find their wants amply requited by planting this tree.

*The Black-barked Weeping Poplar and the Parasol*

incur in securing a specimen, and giving it the protection it requires.

*The Weeping Japan Sophora*, one of the most beautiful trees, is not quite hardy here, and is not propagated in the nurseries. We have a fine specimen tree, however, which thrives in a sheltered position, the same as that occupied by the Sequoia, or big tree of California. The Golden-barked Weeping Ash, a handsome weeper, is not hardy.

*The Weeping Cherries*.—Everflowering Weeping, *Avium pendula*, *Bigarreau pendula*, are all pretty lawn trees, but not sufficiently known to be properly appreciated. On some future occasion I hope to be able to call attention to these more particularly. It should be borne in mind by those intending to plant drooping trees, that their appropriate position is always on the open lawn, single, never in groups or masses, nor mixed in with other trees or shrubs in

**EUCALYPTUS AMYGDALINA.**

FROM Baron von Mueller's admirable treatise on Eucalyptographia we extract the following:—

This Eucalyptus is one of the most remarkable and important of all plants in the whole creation. Viewed in its marvellous height, when standing forth in its fullest development on the slopes or within glens of mountain forests, it represents probably the tallest of all trees of the globe; considered as a hard-wood tree, of celerity in growth, it ranks among the very foremost; regarded in reference to its timber, the tall variety can fairly be classed with the superior kinds of Eucalypts, and contemplated in respect to the yield of volatile oil from its copious foliage it is unsurpassed, and perhaps not equalled, by any other tree in the whole world. These various signal qualities of *E. amygdalina* having become gradually known,

much through the exertions of the writer, this tree has found already a wide appreciation abroad in countries neither subject to severe frost nor to intense moist heat. It assumes under different climatic and geological conditions various forms; thus in the irrigated ravines of cooler ranges the tree attains the most towering height, combined with a perfect straightness of stem, while the outer layers of its bark decorticate so completely as to render the huge stems quite smooth and almost white, the habit then being that of its only rival in loftiness among its congeners, namely, *E. diversicolor* (the Karri of West Australia). According to Mr. F. Abbott, it is this form which constitutes the Swamp Gum-tree in Tasmania, where Sir William Denison placed its huge dimensions on record. In more open and in merely ridge country, *E. amygdalina* remains much lower in stature, even often a comparatively dwarf tree, with outside rough, inside tough, somewhat fibrous bark, which remains more or less persistent on the stem and even lower branches; under such conditions the species is called a Peppermint-tree in Victoria and Tasmania, and a Messmate-tree in some tracts of New South Wales.

*E. amygdalina* is one of the hardiest of its congeners, and if *E. coccifera* constitutes an alpine state of it, then it has in that remarkable form braved even unusually cold winters of Britain. For instance, at Powderham Castle, the seat of the Earl of Devon, it passed unscathed through an ordeal of  $+9^{\circ}$  of Fahrenheit's scale, while *E. globulus* was destroyed at  $+20^{\circ}$  Fahr. The above-noted severe cold caused *E. coccifera* no injury whatever, so that perhaps it will withstand a still somewhat lower temperature; it produced in the subsequent summer thousands of sprays of blossoms. Its height at Powderham Castle was 58 feet, the stem measuring at  $3\frac{1}{2}$  feet from the ground  $7\frac{1}{2}$  feet in circumference; it grows there on sandy loam on rising ground. [See *Gard. Chron.* 1879, vol. xii., p. 113.]

Mr. D. Boyle first of all ascertained the length of a fallen tree of this species, found by him in the Dandenong ranges, at 420 feet, the length of the stem up to the first branch being 295 feet; the diameter of the stem at the commencement of the ramification proved 4 feet, 70 feet higher up the diameter was 3 feet, the top portion was wanting. A still thicker tree there measured at 3 feet from the ground 53 feet in circumference. Mr. Boyle found another tree with a stem 25 feet in diameter at the base, yet the bark quite thin. Mr. Howitt obtained in Gippsland also measurements up to 410 feet. The Rev. Th. Ewing (as stated in Hensley's *Botanic Gazette*) measured a prostrate tree on a rill of the North-west Bay River at the rear of Mount Wellington, thirty years ago, and recorded the height up to the first branch as 220 feet, from thence to where the top was broken off 64 feet more; the basal diameter proved to be 30 feet, the stem-diameter at 220 feet was still 12 feet, and to that distance it would turn out more timber than three of the largest Oaks taken together with their branches. A standing tree at the same place measured, at 3 feet from the ground, 102 feet in circumference, but close to the ground even 130 feet! The reverend gentleman observed within a square mile at least 100 trees, none less than 40 feet in circumference at the base. Mr. G. Robinson noticed in the back ranges of Berwick the circumference of a stem to be 81 feet at a distance of 4 feet from the ground. (See Ellwood Cooper's edition of some of my lectures and essays, p. 161.) The same gentleman, whose professional judgment as a surveyor would give every guarantee for accuracy, obtained at the foot of Mount Bay-Baw the measurement of an exceptionally large tree, which was 471 feet high. From the Cape Otway ranges a tree is also on record by Mr. Walter, with a height of 415 feet, and a basal diameter of 15 feet, although the loftiest trees have not always the most colossal stems.

The utmost praise is due to Joseph Bosisto, Esq., for his lengthened and extensive researches on the oil of this and other congeners, to the technical productions, local utilisation and mercantile export of which he has given large dimensions by his enterprise and perseverance, it having fallen to the writer's share to draw in the first instance attention to the enormous yield of oil from the foliage of *E. amygdalina*. Mr. Bosisto sums up his experience with the Eucalyptus oils, as regards the percentage of the yield of the various species on which he experimented, in the following schedule:—

From 1000 lb. of Fresh Leaves with their Stalklets and Branchlets—

<i>Eucalyptus viminalis</i> yields .. .. .	7 oz.
" <i>meliodora</i> yields .. .. .	7 "
" <i>rostrata</i> yields .. .. .	15 "
" <i>robiquia</i> yields .. .. .	80 "
" <i>globulus</i> yields .. .. .	120 "
" <i>gobionolys</i> yields .. .. .	150 "
" <i>leucocorymbus</i> yields .. .. .	160 "
" <i>oleosa</i> (mixed with other species of the Mallee scrub) yields .. .. .	250 "
" <i>amygdalina</i> yields .. .. .	500 "

## THE HORTICULTURAL OUTLOOK IN IRELAND.

NEVER within the memory of the present generation has horticulture been at so low an ebb in Ireland as it is at present; indeed, if matters do not soon take a favourable turn, the majority of Irish gardeners will have to turn their attention to some other means than that of horticulture by which to earn a livelihood. In all directions we hear of gentlemen discharging their gardeners and filling their places with grooms, garden labourers, or such-like utilitarians. No doubt many people will be found to assert that this state of affairs is to be attributed altogether to the severe and widespread depression, combined with tenant-right agitation, which has now existed for the past twelve months and more. That the causes just named have had something to do with the matter we are quite willing to admit, but we also feel perfectly confident that these are not the sole causes.

It is a notorious fact that there is no greater tyrant, nor any to whom more abject devotion is paid, than fashion. This is just as true with regard to gardening as it is with regard to the particular style in which ladies wear their hair. But as the fashion in gardening is, in our opinion, of much more importance than the decoration of ladies' persons (we fear we shall be looked upon as very ungallant for saying so), we consider the leaders in it should be particularly careful as to the way in which they set it. As a matter of course, we look to Her Majesty's representative in Ireland to show a good example in horticultural matters, for it is but natural to expect that the many noblemen and gentlemen who visit the Viceregal gardens will, to some extent, adopt at their own residences what they see there. Consequently it is of considerable importance—far more so than may at first appear—that these gardens be kept in the best possible condition, and be models of what a private gentleman's gardens should be.

Some eighteen months ago we were reluctantly compelled to notice the way in which these gardens were managed, drawing attention to the very extraordinary fact—a fact which has never since been contradicted—that they were being utilised for the purpose of supplying the Dublin markets with fruit, flowers, and vegetables! Notwithstanding our remarks at the time, and the unfavourable comments in the daily press, this system of market gardening was continued during the period that his Grace of Marlborough held the office of Lord-Lieutenant. Such a proceeding could not fail to have—as we prophesied it would—an injurious effect on Irish horticulture, and the result has abundantly proved the correctness of our views. The market garden system inaugurated at the Viceregal Lodge was quickly and extensively followed by noblemen and gentlemen in all parts of the country; so that instead of gardens being kept as heretofore for the pleasure of the owners, they have in numerous instances come to be looked upon as a source of income. A combination of pleasure and profit is all very well in its way, but any attempt at sacrificing the former to the latter in the particular case now under consideration is utterly uncalled for and out of place. The paltry few shillings made by such transactions are but a poor recompense for the contempt brought on those concerned. To our own knowledge, several gentlemen, some in the neighbourhood of the metropolis, others in distant parts of the country, have discharged their gardeners and taken on handy men, whom they consider in every way fully competent to grow vegetables, &c., for market. As we have already said, to the pattern set by the late Lord-Lieutenant this very undesirable change is in a great measure due. Whatever cause our famine-stricken poor have to be grateful to her Grace the Duchess of Marlborough, certain it is the gardeners of Ireland have no reason to be thankful to the Duke. However, there is no use dwelling too much on the past, we must look to the future for a remedy; and it is to be hoped that with the new Viceroy a different order of things will be instituted,

especially in the matter of gardening. Surely, with such a princely income as His Excellency is reported to be possessed of, there will be no necessity whatever for continuing the cheese-paring policy which has reigned supreme during the past three or four years. Let us have no more caricatures of greengrocers, but let the Viceregal gardens be again devoted to the purpose for which they were originally intended, and maintained in a way befitting the dignity and high position of Her Majesty's representative in Ireland.

In conclusion, we wish it to be distinctly understood that we do not for a moment attempt to identify Mr. Smith, the worthy chief of those gardens, with the remarks we feel called on to make regarding their management. We feel sure it was not his desire that he should have to enter into competition with market gardeners, and we are confident that he would be only too glad were the means placed at his disposal to make these gardens what they ought to be—the first in the country. *Gardeners' Record.*

## PUBLIC TOWN GARDENS.

FEW acts of our metropolitan authorities have been productive of more positive good to the London poor than the conversion of huge wastes or small enclosures into public parks and gardens, where not only may the masses get pure air but also some insight into those elements of rural life that gardening so brightly and effectively illustrates. With the formation of Battersea, Victoria, Finsbury, and other parks, with the formation of public gardens on the Thames Embankment, with the opening to the children of surrounding crowded courts of the Temple Gardens at certain periods, with the opening of the Royal Horticultural gardens on Bank holidays at a nominal charge—with these and other movements, of which the one to open to the public the large gardens in Lincoln's Inn Fields is the latest, we have abundant evidence of the interest taken in the welfare of the poor on the one hand by those in authority, and on the other not less pleasing proof of the high appreciation for these gardens and ornamental spaces which the masses evince. Not only should the agitation now being made in favour of the opening of the Lincoln's Inn gardens be persevered in until successful, but it should be the effort of the promoters to secure for the public the same privilege in every open space of a semi-public nature that is in the metropolis. There is in Charterhouse Square a plot of greenery and umbrageous trees enclosed by high strong rails into which numbers of poor children may gaze with envy and longing, but wherein they may not enter. Not more impossible for them is entrance into the Paradise of the Peris than it is here. Yet at no time are there to be seen more than some half dozen children of wealthy parents, who can afford to give their offspring a thousand pleasures to which the poor little ones are strangers, and yet this bit of greensward and leafy shade, this oasis in the desert of houses and hot, noisy streets, is locked up, and the public is denied access. There is in Finsbury Circus even a more charming spot than is the one just mentioned. It is really a garden, and well kept. Its trees, with their luxuriant foliage, fairly surprise those who suddenly alight upon the garden. Here for a few years was held the City of London Flower Show, but two years since the little Arabs made so merry in their unwonted liberty, that some damage was done to the flowers, and the place has been closed against the show since.

These two are but illustrations of many others spread throughout the metropolis, where certain limited proprietary rights intervene, and keep shut against the public these open spaces. It may be that too much would be demanded if it were proposed to buy up the proprietary rights over all these enclosures, place their care in the Metropolitan Board of Works, and make them henceforth and for ever public gardens; but some kind of compromise may not be impossible. Certain days, or portions of days, or portions of the year, may become public days or periods, and thus the proprietors would be saved some of their privileges; but it is most essential that in the locality of crowded poor neighbourhoods these enclosures should become the property of the public. Grown wiser now than were our forefathers, who could never have imagined that London would have grown to what it is, we have made some outside provision for the public recreation, and it is now all the more important that every open space, however small, should become public for ever.

## VERBENAS FROM SEED.

We have already passed the period of the year when the spring-time smile spreads over the face of Nature, and the gardener lays himself out to set in motion a series of activities, of which sowing is one of the most pressing and important. There is ordained for mankind many duties, and the "benignant toils and tender cares" inseparable from the garden overflow in the pleasurable and healthy excitement in the spring-time. Let the winds roar and the rains fall, let frost and snow again essay their strength, the reign of violence is over, and each dawning day serves to weaken the force it seeks to exert.

The peculiar pleasure derived from raising seedlings—the hopes and uncertainties that are inseparable from it—the upspringing in glory of some forms of satisfying beauty—or the appearance of others in gross and unworthy characters, need not be touched on in this relation. It is an occupation full of subtle satisfaction to any one who can open his soul to the reception of things clothed in the grace of the beautiful. And to ensure this as far as possible he should sow good seed—not only good in relation to its growth, but rich in that higher form of goodness likely to largely reward the sower's toils.

It sometimes falls to the lot of the sower to have to complain that the seeds he puts into the ground with so much care do not germinate. It is not unfrequently laid to the charge of Verbena seed that it does not grow; and the accusation is laid at the door of the seedsman that he did not supply good seed, when it does not occur to him who fails with his seed that it might be owing to a want of knowledge or skill on his own part. You can no more coerce seeds, and the laws by which they germinate and grow, than you can sentient animals; perhaps the latter are the most plastic in the hands of him who uses force. There is little difficulty in raising Verbenas from seed if only the right method be adopted; and it need scarcely be stated, that he who sows should care only to operate with seeds likely to produce appreciable results in point of quality.

Mr. Henry Eckford, in the days when he was a raiser of new Verbenas, was very fortunate in getting large batches of seedlings. His invariable practice was to sow about the middle of March, or a little later, in any convenient sized pots, using a fine sandy loam, and taking care to have the pot well drained. The seed was sown thinly, and then covered to the depth of a quarter of an inch or so with fine soil, and the pots placed in a brisk heat of some 65° or 70°, the surface of the soil being kept constantly moist, on no account being allowed to become dry. Good seeds of the Verbena quickly germinate in such a temperature, and in three weeks or a month the plants will be fit to handle, when they require to be pricked off into pans or boxes, 2 inches apart, and as soon as they get hold of the soil they should be gradually hardened off till placed in a cold frame. The sooner the plants are there the better; heat is not required except to raise plants from seed, and is more hurtful than otherwise to them when growing into size: it induces red-spider, and if affected in this way in a young state it is difficult to rid the plants of it.

Mr. Eckford's practice was to plant his seedling Verbenas out in the open ground on a well-prepared border, generally by the beginning of May. As the seedling plants make a generous growth, the ground in which they are planted needs to be deeply dug and well manured, making a liberal use of decomposed manure. In selecting the site of the flowering bed or border an open situation should be preferred.

Little needs to be done during the summer besides keeping down weeds and stirring the surface soil. As the plants come into flower the raiser should note all as they open their blossoms, pulling out any of an inferior character, and placing a mark against any of a promising appearance. If these do not prove good enough for naming they may be worthy of propagation for general purposes, as well as for saving seed from for sowing the next season. We have by no means attained to perfection in the Verbena, and there is much to be done before we shall reach this stage of attainment. To assist in bringing as much perfection of ideal as possible into his flowers, the florist crosses his best sorts, taking the pollen from

one and putting it on another by means of a fine camel's-hair brush, without, however, attempting to remove the pollen deposited in the course of Nature, which would be a very tedious operation, if, indeed, it could be performed without injuring the flowers. Even without fertilising any of the flowers as just described, much can be done by taking seed only from the best flowers, and so selecting the best possible for seed parents.

If any one be wishing to set about raising seedling Verbenas, he should make a good selection of varieties to work with. Such fine flowers as General Fiction, Neptune, Lord Leigh, Earl of Beaconsfield, Shakespeare (an old variety, but still one of the best), and Favourite, should be secured. There are, as yet, but few Verbenas of good shades of blue and purple, as generally these colours turn pale and become washy. Kentish Beauty is well coloured, but has the open centre of truss so fatal to many good varieties that would be otherwise fine exhibition flowers; and Blue Superb, bright pale blue, with large white eye, is worthy of notice. Of cerise shades the best are Sparkler, wanting in form, but with a showy white eye; Star of Erin, and Admiration—very pretty colour, and sometimes flushed with blue. Of lilac, pink, and mauve shades, there are Lady Leigh, Apollo, very large truss; Swanley Gem, opens blue lilac, changing almost to greyish blue; Master R. Cannell, pale pink, tinted with purplish magenta, fine truss; and Lady of Lorne, blush, with pink centre. The best white Verbenas are the old Boule de Neige, and Edward Perkins, white with magenta eye, but somewhat rough in the truss. There are yet some pretty striped flowers that ought not to be absent from a collection—viz., Miss Matilda, striped and marked with purple—very pretty; Princess of Wales, white and pale purple, quartered; Esmeralda, white, flaked and distinctly lined with blue-purple; Lady of Langleybury, an old striped sport from Purple King, and yet worthy a place in every collection; and Swanley Gem, flaked with pale magenta on a white ground.

Let this collection, or a selection from it, be purchased in the spring, and planted out on a well manured open border; some seed taken from the sorts that find most favour with the grower; and something good and satisfactory may result. But one leading aim of the raiser must be to have a good compact and vigorous habit of growth in association with the most desirable qualities in the flowers. R. D.

## THE ELM AS A ROSE-PROP.

Of some twenty varieties of Elm enumerated in Loudon's *Hortus Britannicus*, over one-third are to be found in British hedges, sometimes so pruned as to be sadly out of character; for even the common Wych Elm is usually well feathered where it has not been trimmed, as it too often is, to look like a scaffold-pole with a crow's nest at the top. To bear ill-usage bravely, and to be the drudge among other gay plants, is the true character of this tree; and this is no new thing for it to do, since we find Homer, in the sixth book of the *Iliad*, making mention of its "barren shade," and of its abode at "the place of the tombs." This trait in the character of the tree is still to be seen, for I planted a churchyard for the elder Pugin with Elms; and in this respect there is little doubt that he did the thing right where he was not fettered for want of funds. Now, as so many old churchyards are closed against further burials, it is an excellent opportunity to adorn the place of the tombs and the green graves of those who are gone before us to their everlasting rest.

Some few years ago the question was asked by some gentleman in the *Gardeners' Chronicle* what they were to do with their fine old churchyards, and what plants would be suitable for the sacred spot where so much that was lovely had been laid, and over whose remains so many tears had fallen. The Elm, as a tree, would here be sadly out of place, but the Elm as a prop to support a climbing Rose is quite a different thing, and we have only to read the account of the Grape Vine "wedded to its Elm" in the sunny South, or even to take a stroll through a Hop-field in Kent, to see what service the Elm is doing. This plant may be called a weed in our hedges, although the lofty Elm trees that adorn the Southern Counties, and all about the metropolis, are grafted or worked, and attain the timber size of sufficient girth to cut up into wheels for gun-carriages,

when they fetch a high price. As props or posts for palings the Elm is well adapted, and it has got much of the coffin trade to itself, on account of its lasting so long underground, and in the wet. But it is not in reference to its wheels, nor for its coffin-boards, that I have taken up the Elm subject, but on account of its being so well adapted to prop the climbing Roses—those glorious specimens that we sometimes see against the walls of some villa, where the owner or occupier has had the good taste to plant one, to prove the envy of all beholders.

Many villa residences have no spread for such plants, but it is easy enough to plant a weeping Elm, worked as a standard, and against this a climbing Rose; so that whilst the Elm will remain, yielding its "barren shade," the Rose will ramble all over the flat table of the Elm, and not only cover that with Roses, but hang down all round in its own graceful style; for while Hop-poles are all pointed stakes, the Elms to which "Vines are wedded" are all alive, and are not driven into the ground, but planted, and their few roots and few leaves are just what are wanted to hold up to admiration not only climbing Roses, but climbers of all kinds that are hardy enough to bear our summer seasons in the open air, most of which, with the exception of the Clematis family, seem to be neglected.

I have bright recollections of the climbers at Cliswick, on walls and arches, many years ago. To use the language of the wine-dresser, these beautiful climbers want wedding to props of some kind, and we are left in no doubt as to what we have to do in the matter, for the Grape Vine never puts out a fruit-bud but it puts out a tendril whereby it may be supported; and this tendril will run long, and turn often, to find a twig on which to hang the bunch of Grapes.

Painted stakes, four-square and pea-green, are the usual props of garden Roses; but I found in practice that a round stick, and of a grey colour, was more like Nature's fashion; and so I planted an Irish Yew against every stake to hide it, and it was curious to see the lively Rose crowning the sombre Yew. I borrowed the idea from a wild Rose that had grown up inside an Arbor-vitæ, and bent down gracefully, laden with flowers, and which differed from Roses propped up, for it was all beauty, with not an inch of grey bark to be seen, and it waved in the summer wind so "wild and well" that we had no other Rose-tree like it, the evergreen Arbor-vitæ giving the green back so much wanted in all nosegays.

The Ash has a pinnate leaf, and as such agrees with the foliage of Roses, but the weeping Ash is the only one suitable to be wedded to the Rose, and that should only be a little higher than the height of a man to be seen to advantage; but, after all, the weeping Elm will bear more trimming and fitting than the Ash, and as it advances in growth very little in a few years, it has the charm of neatness, which the weeping Ash never has, for its bending boughs are large and coarse, frequently bare, like a bald head, at the top, and full of twigs at the bottom.

The system of planting two trees where we formerly planted only one may be seen in various specimens; and where two or three Rose plants can be got into one pot, it is good practice to get them in. Some years ago it was the fashion in well-kept gardens to hoe and rake the front of shrubberies, as if black and barren earth were ornamental, whereas the clean bright greensward ought to be the carpet spread under the Rhododendron as well as the Rose; and fortunately the Rose family so abounds with dwarfs, runners, climbers, &c., that we read in Canon Hole's *Book on Roses*, of some that saluted him from the church wall. I had to give over growing some ramblers on account of the nails and labour they took to cover a high stone wall, which they do well, covering the wall at the rate of 30 feet in one summer. So well are Roses classed in the new catalogues, that one has only to name what is wanted to our great growers to get well suited.

The late Duke of Northumberland wanted to stop parties from getting over the ha ha in front of Syon House, and as his Grace knew plants well, he had a climbing Rose planted there, and it politely warned people to go some other way; indeed, after one summer its horrid hooks had but to be seen to get a wide berth. The difference here named is to use a living prop instead of a dead one—one of slow growth, planted, instead of a pole driven into the ground. Alex. Forsyth.

## THE WINTER AT ELVASTON CASTLE.

We never realise that which comes to our knowledge by hearing so fully as by the evidence of our eyes, yet after what has become known of the severity of last December's frost in some parts of England, most people conversant with the effects that an exceptionally low temperature has upon outdoor vegetation when following a wet, sunless summer like the last, will be prepared to hear of much destruction in localities where the temperature was lowest, such as in the southern portion of Derbyshire, and about Elvaston, where the land lies flat, and the soil and air are charged with moisture. The winter of 1860-61 told severely on many of the grand Coniferous and kindred evergreen trees for which Elvaston is so celebrated. A recent visit enabled us to see that many things have succumbed which came out unscathed, or only slightly injured, nineteen years ago. Portugal Laurels seem to be completely killed; from those which have been planted half a century with stems that have attained the thickness of a good-sized tree, to the low clipped hedge that bounds the long walk leading from the kitchen garden to the pleasure grounds all appear to be destroyed. Some of the Araucarias left by the frost of 1860-61 have again suffered little, others are so much injured as to be useless. Deodars have been so far denuded of leaves as to give them an appearance like the deciduous Cypress, but they are now breaking freely. Even the well-proved Cedar of Lebanon has lost half its leaves. Pinus insignis, planted to replace those destroyed in the 1860-61 frost, again all quite killed; P. macrocarpa so far affected as to be worthless; P. Coulteri badly cut, but not so much as the last. Of the many examples of Wellingtonia some are not much worse, but the greater portion are severely browned, and some killed or beyond recovery; one, a fine tree, standing at the top of the church avenue, with a stem 8 feet in girth, is quite dead. Gorse, both the double and single variety, is killed down to the roots. The female Chinese Junipers are all but killed; the male plants are untouched; Abies Douglasii somewhat injured in the foliage. Picea Pinsapo here, as in most other places, has lost its leaves in the extremities of the shoots, but the wood is uninjured. The common green Holly and varieties like the gold and silver Queen, maderensis, Cunninghamii, and the Milkmaid, of all of which there are such quantities up to 20 feet in height, many are killed outright. Waterer's Holly, a row of which stood on each side of the road leading from the back entrance—specimens of a size rarely met with—seem totally destroyed. Several Walnut and Mulberry trees of considerable size, looking not less than forty years old, are quite killed. The many Vew and Box hedges have the points of their shoots killed, but will apparently break out again; those that have been cut, so as to keep them within the least size, have suffered worse than where let to get larger. All the Menziesias seem quite dead. The above in a great measure comprise the things that have been affected more or less to the extent described. It is a heavy list of death or injury; but there is the satisfaction accompanying the last winter's experience at Elvaston, that the many fine species of evergreen trees which have come safely through the ordeal may be fairly reckoned to stand anything in the shape of cold we are likely to have, as we understand the thermometer fell on two or three nights some 10° below zero! *T. B.*

## THE CATALPA AS A TIMBER TREE.

Much has been recently said in regard to the Catalpa as a timber tree, and, as it would appear from very recent information, Professor C. S. Sargent, of the Bussey Institute, has directed attention to it, and spoken highly of its value and urged its cultivation, I believe, for that purpose. It appears, however, that its importance as a timber tree was known half a century ago, and its culture recommended by one so capable of judging as the late President of the United States, General Harrison, of Tippecanoe fame. In June, 1831, General Harrison delivered an address before the Agricultural Society of the county of Hamilton, Ohio, in which he spoke of the Catalpa as follows:—

"In acknowledging the progress our country has made in rural economy, it is painful to notice how little we have advanced upon the method of fencing now in use, or in the substitution of enclosures more durable and at the same time more economical. Our old rail fences, whose dilapidated appearance produces a disagreeable effect around our farms, are as wasteful and expensive as they are inefficient, and the increasing price of timber and the great quantity which will be required demands speedy improvement, for the country is likely to soon lose the material for their construction. If we could procure posts and rails of the Locust or Mulberry they would last, without doubt, a great many years; but the wood of the Catalpa, a tree of such easy culture and of such rapid growth, furnishes, perhaps, a material much more durable than either of the others. This valuable tree is indigenous in the lower or southern part of Indiana, and grows to a very large size upon the Wabash River and several of its tributaries. Its property of resisting decay has been sufficiently verified in the vicinity of Vincennes, where the soil is saturated with water. One of these trees was cut down on the little stream of the Detha, five miles from Vincennes, before there was any emigration from other States. It was certainly a giant in the year 1785, when a colony of Virginians from the Southern Potomac settled there, and this Catalpa served for a foot-bridge for crossing the river. I have been informed by a worthy man, in whom I place great reliance—Dr. Hiram Dickson—that he has recently seen this tree, and found it but slightly injured from the moisture; and he assures me at the same time that a fence built with posts of the Catalpa which had been set in the ground in 1770, by his father, had been recently taken up and reset on his own farm, by his brother, Major André Percell: it had been found yet perfectly sound, and quite as good for the purpose as those which had been put down to take their place. The Catalpa is a very beautiful ornamental tree, but I do not think it is appreciated or has been employed as a timber tree elsewhere than in the neighbourhood of Vincennes. It grows with remarkable vigour upon the farm of my cousin, Mr. Short, where it is increased by seeds; and I believe that in places where timber is scarce, and the soil suitable to its growth, it offers very great results, not only for fencing, but for the construction of all kinds of buildings."

The above extract from General Harrison's address I translate from the *Annales de Fromont*, vol. iv., where there is a brief account of the Catalpa by the late M. Chevalier Bodin, the well known horticulturist and proprietor of the once famous Fromont Gardens, near Paris, as also the raiser of Magnolia Soulangeana. M. Bodin probably quotes from the western papers of the day or from the address, which may have been published, and perhaps forwarded to him. He does not state from what source, or I should like to refer to General Harrison's original and undoubtedly highly interesting address. It will, however, show that our native Catalpa was considered a neglected and valuable timber tree fifty years ago, whatever its nearly related species—a variety recently introduced from Japan—may be. *C. M. Hovey.*

## Foreign Correspondence.

TEN DAYS AT TUNIS.—Goletta, the harbour of Tunis, stands on the western side of the narrow bank which separates the bay of Tunis from the shallow inland lake, on the further side of which the city itself is built. Until very lately it was necessary to cross this lake in a flat-bottomed barge, poled tediously over the shallow water, but now a railroad made by an English company runs round the lake, and takes the traveller in half an hour to the gate of Tunis. On the left you have the muddy shore, overgrown with *Salicornia* and *Atriplex*; on the right a broad open plain, now brilliantly green with young corn, among which *Tulipa sylvestris*, nodding its head to the breeze, may be noticed in passing. *Asphodelus ramosus* and *fistulosus* also catch the eye, and the golden *Senecio leucanthemifolius* is even more general than in Malta and Sicily.

The country round Tunis is bare and open, rising into low hills or expanding into wide basins, but everywhere without any trees larger than Olives, and everywhere green either with the young corn or with the equally brightly-coloured growth of weeds which has sprung up on the fallows. My first walk outside the town procured me the prevailing corn-weeds. *Fedia cornucopiae* and *Linaria reflexa*, so common in Sicily, were here associated with the handsome *Linaria triphylla*. *Fumaria spicata* and *agraria* were mixed with *F. parviflora* and the universal *F. officinalis*. Large *Silenes* were abundant, not only the wide

spread *colorata*, but also *S. rubella*, rose-coloured, with a white eye, and *S. fuscata*, with its curiously curved calyx. There was *Adonis*, deep red and orange, perhaps varieties of the same species, *festivalis*. There was *Moricandia arvensis* and various *Charlocks*, of which much the most common was *Sinapis alexandrinensis*. Another plant, conspicuous with its large yellow flower and abundant snowy pappus—*Othonna cheirifolia*—grew in great clumps among the corn, as if it had successfully defied the plough to extirpate it. *Nonnea pulla* and a large-flowered *Cynoglossum* occupied dry bits of waste, and on the fallows *Geranium tuberosum* was the most usual flower, where also *Bellevalia romana*, *Muscari racemosum* and *comosum*, and *Ornithogalum umbellatum* were in bloom.

The only variety of crop from the great expanse of Wheat was a field of *Trigonella Fœnumgræcum*, but so small and stunted that, with the flowers clustered together in a head on the plant scarcely more than 6 inches high, it had much more the look of a *Trifolium* than of a *Trigonella*.

On the dry uplands, uncultivated but pastured by sheep and goats, I found one or two Orchids, *Ophrys lutea* and *Orchis saccata*, *Daphne Tartonraira* and *Calycotome spinosa*, *Helianthemum thymifolium*, and a curious stemless Centaury, *C. nana*, whose flowers are collected for their sweet scent. Boys were carrying branches with a flower stuck on the end of each twig, and they are also used by the Moors to put among linen as Lavender is in Europe. On the east side of the town are some low rocky hills crowned by forts and mosques, and their slopes covered in great part by ancient graves. This was the only ground which I could not examine. Mahometans are very sensitive to the intrusion of infidels on their graveyards, but, with this exception, I found I could go everywhere without the slightest risk of molestation. On the further side of these hills I was free to look for the plants which grew on the almost bare white limestone. Conspicuous was *Fagonia cretica* with its very handsome purple flowers, certainly deserving of garden cultivation, also the deep orange-coloured *Glaucium corniculatum*. Here, too, grew *Lavandula multifida* and the curious *Carrichtera annua*, *Globularia Algyptum*, *Thymus capitatus*, &c. I was fortunate enough to discover an extremely rare *Medicago*, *M. secundiflora*; Baron Cesati, who kindly determined it for me, informs me that it has only once before been found—by Cosson, at Constantine in Algeria. Growing mixed with it was *Medicago elegans*, whose pod is like an Ammonite in miniature; *Trigonella monspeliaca*, the graceful *Paronychia argentea*, and various other spring flowers which are common in Italy. Returning another day to Goletta, I walked across the sandy plain some 3 miles to the low hills breaking down on the sea, which are covered by the ruins of ancient Carthage. Near Goletta the sand was brilliant with the pale lilac flowers of a *Romulea* which seems to be very nearly allied with *R. ligustica* of Parlatore. *Trigonella maritima* with its Coronilla-like umbels was in such abundance as to spread over the permanent way and among the sleepers of the railroad. *Triglochin Barrelieri*, with its bulbous roots, marked the damper spots. On the slope of the hill, over which stands the chapel, erected by Louis Philippe to the memory of his ancestor Saint Louis, whose death happened at this very place, there grew a handsome *Ononis* with a pink and white flower, probably *geminiflora*; a tall *Astragalus*, whose name I have not been able to determine; a *Vicia* akin to *lutea*, but with a purple flower; and a *Medicago*, with a pod like that of *M. orbicularis*, but only half its size. I take it to be *M. lœvis*, which Desfontaines describes as having been found in this very neighbourhood.

Of Carthage itself there are absolutely no remains except shapeless masses of masonry and foundations of buildings which have long ago disappeared. On them I found *Arenaria cinerea* with its pretty carmine-coloured blossoms, and a handsome *Verbascum* coming very close to *V. virgatum*. Further on, among the Olive groves which surround Marsa, a small village on the shore, where the Bey of Tunis has a summer palace, *Anemone coronaria* was plentiful, and a tall *Kanunculus*, *R. millefoliatus*, rose above the young corn. Close to the sea I found at last (and this was the only place where I saw it) *Genista monosperma*, in full blossom and deliciously sweet. Under its shade grew *Ophrys fusca*, and not far off *Ophrys bombylifera*, with its tuber connected with the stem by a long fleshy sucker. Here also

first saw *Ophrys funerea*, which is more common on the Hammam-el-Emf mountain.

This mountain rises from the shore with a picturesque double peak to a height of 1200 feet or more, at a distance of 8 or 10 miles to the east of Tunis. At its foot are the Hammam or hot springs of El-Emf—salt-water—and said to be of great efficacy in rheumatic complaints, but quite without any of the civilised

blossom, while *Cistus fastigiatus*, with its small white flowers, had hardly begun. *Tulipa sylvestris* in a dwarf form was not uncommon, more sweetly scented than I ever remarked it. Why do not florists, by crossing with this species, attempt to add the only charm wanting to our garden Tulip? I met with *Linaria simplex* on a level shoulder immediately below the two peaks of the summit, and *Ranunculus*

greater than it generally affects. From these same rocks I secured *Ruscus Hypophyllum*, and a large *Scrophularia*, perhaps *trifoliata*, but I was unfortunately not able to reach the root-leaves, whose shape is so important in determining the species. Another day I took the railroad which runs westward parallel to the coast, and which in a few months will be completed to its junction with the French lines of

FIG. 129.—ASPARAGUS PLUMOSUS. (SEE P. 760.)

appliances for using them. Immediately on leaving the baths I met with great masses of a *Cyclamen* having white petals and a rosy eye, which from its deeply serrate leaves would seem to be *latifolium* of Sibthorp. At an elevation of 300 or 400 feet I came upon bushes of the famous *Thuja articulata*, but on the whole mountain I found nothing larger than a bush of this or any other tree. A handsome shrubby *Erica*, *E. multiflora*, was nearly out of

character was common up to this height. On the steeper slope above was a quantity of a large *Ranunculus*, perhaps *spicatus*, and an *Orchis*, principally with white flowers, but identical, I think, with the common *O. mascula*. Close to the top was *Anthyllis Vulneraria*, the variety with crimson flowers; and on perpendicular rocks, quite out of reach, a large white flowered *Brassica*, probably no other than *B. oleracea*, though the distance from the sea is rather

Algeria. The general character of the country remained the same over the 30 miles which I traversed, wide basin plains, rimmed around by low bare hills, perfectly treeless, and either uncultivated or under an immense breadth of Wheat, which everywhere seemed most healthy and promising. Little water—we only crossed one small river—and scanty inhabitants: a few small villages were all I saw, but there seems to be a scattered population of cultivators

and shepherds, who live in more or less temporary huts near their work. The station to which I went, Medjaz-el-Bab, was a staring red-brick house standing solitary amongst a sea of corn in the centre of a broad basin 5 or 6 miles across. I struck across to the hill border, which was extremely rocky and barren. The soil was bare between bushes of dwarf Rosemary and *Calycotome spinosa*, mixed at the highest point with *Juniperus phœniceus*. *Helianthemum salicifolium* and *egyptiacum*, along with *Ranunculus chærophyllus* and *Ophrys funerea*, were thinly scattered among the rocks, and *Lithospermum apulum* was associated with an *Alkanna*, having a brilliant blue flower, and therefore it may be, not *tinctoria*, but *strigosa*. On the level among the corn was a quantity of *Narcissus*, which did not appear to differ from the common *Tazzetta*, and the fallows, which rest for years before they are broken up again, bristled with *Asphodelus ramosus*. *Paliurus aculeatus* formed large islands among the corn, from 2 or 3 to 20 yards across, the cultivator finding it better to guide the plough round such masses of tangled roots than to attempt to grub them up. Everywhere by the side of the roads was *Mandragora officinalis*, showing, as usual, a few of its pale blue *Gloxinia*-like flowers in the spring, but reserving its full bloom for the late autumn.

Here, as elsewhere, I could not help remarking how much chance there is in the collections made during a hasty visit to a country. I got single specimens of so many plants which, but for the accident of my meeting with a solitary individual, I should not have known to belong to the flora of Tunis. I found here one, and only one, specimen of *Convolvulus tricolor*, the same with *Securidaca coronilla*, the same with *Reseda phlyteuma*, the same with a handsome *Althæa*, which I could not name from this one specimen. So, too, the class of plants found depends greatly on the season of the botanist's visit. It struck me as remarkable, when I arrived at Tunis, that there were absolutely no grasses in flower, scarcely even the universal *Poa annua*. But on the last day of my stay I came upon several, including *Lamarkia aurea* and *Schismus marginatus*, and no doubt a few days more would have added largely to the number. The great genus *Trifolium* was without representatives in my collection until almost the day of my leaving, when *T. stellatum* began to show itself everywhere, and *T. tomentosum* also broke into flower.

Looking at the mass of the 235 species which I collected at Tunis, the general impression is that the flora is one almost identical with that of South Italy. Less than twenty of my species are not Italian, and there are perhaps not more than two which are distinctly not European. There is the *Thuya articulata*, which, even in classical times, was recognised as African; and still more, *Othonna cheirifolia*, an outlying member of a large genus, all the other species of which, forty or fifty in number, are Cape plants from the extreme South of Africa. About a dozen more (*Geuista monosperma* and *Fagonia cretica* are examples) are extremely rare denizens of Sicily and Sardinia, and it seems highly probable that they are African species of comparatively recent introduction into those islands. Migratory birds are continually bringing the seeds of plants from Africa to Europe. A Palermitan friend lately informed me that when he was a boy he and his companions used to ask that the crops might be kept for them of the quails which were cooked in the kitchen. These crops contained numbers of seeds, which the boys sowed, and there was great rivalry among them as to which should raise the largest number and greatest variety of plants. The same process occurring in Nature, must be always tending to extend the African flora towards the North. So far, however, as the evidence of my collection goes, it would appear that there is a still closer connection between the flora of North Africa and that of Spain than that which unites it with the flora of Italy. Not only are several plants in the list common to North Africa and Spain which are absent from Italy (*Ononis geminiflora*, *Leucanthemum setabense*, *Schismus marginatus*, are examples), but other plants which are rare and occasional in Italy are among the most plentiful alike in North Africa and Spain. So I recognised at once *Fumaria spicata* and *Carrihtera annua* from having seen them many years ago as common weeds at Malaga, although in Italy, though they exist, I have never had the chance of meeting with them. It is a matter for speculation whether this difference results from an earlier separation of Italy from the African continent or only from the greater similarity of the climate of Spain to that of North Africa. A.

## Notices of Books.

**An Elementary Text-book of Botany.** By Dr. Prantl; the translation from the German revised by H. Vines, M.A. Swan, Sonnenschein & Allan.

To those to whom Sachs' *Lehrbuch* is too voluminous, this translation of a now well known handbook may with confidence be recommended. The Editor has adopted Sachs' classification of Thallophytes, which must be looked on as provisional only, for it would seem probable that the Protophytes may simply be states or forms of some more highly endowed organisms, and capable of developing into them when circumstances are favourable. The prominence given to the product of the reproductive process is stated with clearness, and divisions are made according as the product in question is a resting spore, a new individual, or a fructification. The morphology of the higher groups is founded on that professed by Alexander Braun, and the classification followed is based upon it. In these points, the book is a truer representative of the state of science than are most of our existing text-books. The value of such a work cannot be fairly estimated until it is tested, not as a reviewer would do, but by actual use by a lecturer or a student. The most cursory examination, however, suffices to show that the book is a great advance upon some older text-books, and is likely to be valuable to those imbued with older ideas by helping to lift them out of the rut of routine.

There are some points upon which discussion might be raised; thus the term "monopodial sympodium" appears to us to be to some extent a contradiction in terms and to convey a false impression. If a "sympode" be composed of successive lateral axes belonging to different generations superposed one to the other, then the term "monopodial," as applied to it, is incorrect, and "polypodial" would be more applicable. The different modes of branching may therefore be grouped as monopodial or indefinite, where the lateral branches from the primary axis are given off in continuous succession; chorispodial or dichotomous, and polypodial or definite, wherein the lateral branches do not all belong to the same generation, as in the true monopodial branching, but represent an interrupted sequence, and belong to so many stages, separated one from another by distinct cessations or arrests of growth. The successive branches do not all arise directly from the main axis or "podium," but the second originates from the first, the third from the second, the fourth from the third, and so on, each successive ramification forming a distinct podium.

The decomposition of carbonic acid and water by the chlorophyll under the influence of light is not considered as a process of assimilation, although on pp. 70, 71, the formation of starch is spoken of as "the first product of assimilation," its subsequent changes being included under the newly devised term of metabolism.

**Introduction to the Study of Flowers.** By Andrew Wilson, Ph.D. W. & R. Chambers.

A well devised little book, as it may well be, seeing that to a large extent it follows the same plan as that adopted by Henslow and Oliver. We demur, however, to some of the opening paragraphs, for instance, it is not true that "every organ or part of a plant is in reality a leaf of one kind or another;" neither does it convey a correct idea to say that the "leaf is in fact the type of the plant." Towards the end of the book, too, we find only three conditions mentioned as altering or modifying flowers, viz., cohesion, adhesion, and suppression of parts, adhesion being stated to be union of unlike parts, which is certainly not always true. In fine, we like the "practical exercises" very much, but we think the author would have done well to have omitted the inferences from them.

— *The Weather of 1879, as observed in the Neighbourhood of London.* By Edward Mawley. (Benrose.)

— This is a very complete account of the weather of each month of 1879, of the different seasons, and of the year as a whole, together with numerous comparative tables, showing the relation of this remarkable year to others. The information here gathered together is so valuable that meteorologists and gardeners are under a heavy obligation to the author. The year 1879 was colder than any year for thirty-eight years, and, with one exception, the most gloomy. The whole twelve months continued from first to last

persistently sunless and cold. The two months, moreover, immediately preceding 1879, as well as the month immediately following it (January, 1880), were all singularly cold ones. The fall of rain was also extreme in the summer, but reduced to a minimum during the winter. Mr. Mawley's pamphlet will have a special value in connection with the records as to the effect of the winter upon plants which the Scientific Committee propose to investigate.

## Garden Operations.

### FLOWER GARDEN.

**BEDDING PLANTS.**—Any kinds that will not bear exposure by this date should be discarded altogether as "bedders," for all such work ought now to be completed by getting out *Alternantheras*, *Coleus*, and fine-foliaged subtropical plants. The first named are indispensable in all foliage arrangements, and are less trouble than any other bedding plants, except those that are perfectly hardy, for, to get up a stock of many thousands not more than a few hundreds of plants need be saved through the winter, and, by adopting the dung-frame mode of propagation and growth, cuttings need not be put in till April, and yet fine plants secured—such as we are now putting out, and which have been no trouble, except as to watering and airing, since they were put in as cuttings after the manner detailed in a former Calendar. Plant out thickly, to ensure immediate effect—and the same remark is applicable to *Coleus* and *Iresine*—to prevent disappointment in the event of the season being ungenial and growth slow. Large-growing foliage plants such as *Ricinus*, *Wigandias*, &c., that are likely to be affected by wind, should be staked as soon as planted; free growth should be promoted by keeping them well watered, and neatness assured by pegging down the undergrowth plants at once. Also peg into form all plants that are used for divisional lines, together with all straggling growers that need such manipulation to preserve the pattern or design. With a view to full effect at the earliest period, growth will be much accelerated by now picking off the flowers from *Calceolarias*, *Violas*, *Verbenas*, *Ageratums*, and *Pelargoniums*, and throughout the entire season all these should be kept from impoverishment, through seeding, by picking off the old flowers the moment they begin to fade. *Lobelias* that may have become drawn in the cutting pans or boxes should, as soon as established in the soil, be clipped over with sheep-shears, which process will ensure their breaking thickly from the bottom, and to the production of stouter flower-stems. That invaluable groundwork plant, *Mesembryanthemum cordifolium variegatum*, sometimes refuses to start into growth freely, and the cause will mostly be found to be its seeding propensities, that are always manifested if the plants have been cramped as to root run whilst in the cutting pots; the remedy is therefore obvious—pick off the seed vessels.

**ROSES, CLIMBERS, AND RHODODENDRONS.**—Roses that were moved last autumn, or this spring, must have water; longer established plants, that were mulched early in the season, may not require artificial watering, though, if convenient, its application would prove beneficial, and particularly where aphid is prevalent, and it can be applied with force to dislodge them at the same time as watering the roots. Hand-pick for grubs, dust the foliage with sulphur, and give copious waterings to destroy mildew. Stake standards: at this season the growth is so rapid that if improperly supported they get top-heavy, and are liable to break off. Proceed with budding as opportunity offers and buds can be had, and keep stocks free from suckers and unnecessary shoots. Secure climbing Roses to supports before their weight endangers their safety, and train and regulate the shoots of *Clematis*, and other quick-growing climbers once a week. Plants of these growing under eaves of houses, verandahs, &c., where rain cannot reach them, should during the summer season have copious waterings and syringings to keep them clear of insects. Such annual climbers as *Nasturtiums*, *Canary Creepers*, *Convolvulus*, *Maurandias*, and *Lophospermums* look most natural when trained by means of pea-sticks, and all of them are useful for forming temporary and quick growing screens for concealment of unsightly objects and corners. Pick off the seed-pods from those *Rhododendrons* that have done flowering; keep grafted varieties free from stock-shoots and root-suckers, and any plants that are making an uneven balance of growth may now be got into form by cutting away

straggling branches, which, if done now, will quickly break into fresh growth. Standards and other single specimens on turf, and in dry positions, should be well watered to promote a healthy vigorous growth, without which good flowers are an impossibility.

**GENERAL WORK.**—Maintain neatness by keeping lawns regularly cut, walks free from weeds, and the edgings trimmed. If dry weather prevails keep bedding plants well watered, and as soon as bedding-out is finished clear away all traces of the inevitable litter connected with the operation. Pots and boxes should be placed in some convenient place for washing and cleaning the same in bad weather, before being finally stored away. Clip Box-edgings, and regulate the growth of any evergreen shrubs that it is desired to keep in bush or other form. Continue to plant out Asters, Stocks, Balsams, and other annual flowers, and make a last sowing of Sweet Peas and Mignonette. *W. Wildsmith, Heckfield.*

#### HARDY FRUIT GARDEN.

We have still a protracted period of drought, which was beginning to cause some uneasiness in horticultural circles where the supply of water is deficient, but a few refreshing showers in the early part of last week has relieved a good deal of anxiety and given some assurance of brighter prospects. As far as crops for the present season are concerned the scanty sprinkling of Pears and Apples are holding fast; and now, as the period for summer pinching is close at hand I propose saying a few words in regard to the curtailment of growth as it is practised in the cultivation of bush fruit trees.

It is cheerfully admitted that a row of dwarf-trained bushes, whether of Pears or Apples, or of both, running parallel with the main walks of a garden, are not only desirable adjuncts in point of beauty at any season, but the fruit (and this is the question), when there is a crop, is of superior size and quality. Of late years, however, a full crop has been of such rare occurrence that this dwarfing system ought either to be abandoned or the roots of the trees confined within a proportionately limited area. With young trees in full health and vigour it is often difficult enough to maintain them in a fertile condition by careful summer management and root-pruning in winter, and how much more difficult is it to keep trees in a fruitful state when their crops are regularly decimated or totally destroyed from one cause or the other, leaving them all the vigour they possess to make soft, sappy, young wood which in time induces a coarse quality of roots and ultimately leads to a state approaching absolute barrenness in the tree. There can be little doubt that the frequent stopping of these soft young shoots in trees with vigorous root-action is the cause of so much canker and decay, for if this be not the cause how are we to account for the exudation of sap which flows so copiously from those knot-like wounds in trees, which are not permitted a natural outlet (a sufficient number of branches) into which this waste of vigour may flow, and yield its fruit in due season? These remarks have a particular and an especial application to districts where the air is moist and damp, where lichens and moss and dead and dying branches abound, and where, consequently, owing to these unfavourable atmospheric conditions, a moderate form of growth should be induced and encouraged. Clearly, I think, it would be a gain if we allowed our dwarf trees more headway, and ceased to pare and prune for the sake of producing examples of mechanical skill. What is wanted is fruit, and there is no disguising the fact that many of our old-fashioned trees are bearing crops this season, while a great many of our fancy-shaped ones are nearly barren. The subject deserves that a leading article should be devoted to it. Wall trees generally are looking well, but black and greenfly, which is fast increasing, will have to be kept under. Where shoots have to be thinned out or pinched back, the fingers should be kept busy at work removing those that are the worst attacked with insects, which will render the use of tobacco-water and other insecticides less needful. Dust Gooseberries with dry lime to keep down caterpillars, and see to the netting of Strawberries in time to save the best fruit from the attacks of birds. Strawberries for dessert or exhibition purposes should be tied up in loose bunches so that the air can play freely amongst the leaves, in order to keep the fruits perfectly clean and also to secure good colour and flavour. Two or three sticks put round a single stool, and a piece of bast mat run round them will answer the purpose effectually. *W. Hinds, Canford.*

#### FRUIT HOUSES.

**FIGS.**—Under good management pot Figs, unlike many other kinds of fruit, improve with age, and when they attain a large size and become well furnished with short-jointed wood, they produce a succession of fruit of the finest quality throughout the summer. At the present time the succession crop on November started trees will be swelling fast, and

some of the most forward will be ripening. Where the spring growths are profusely set with fruit, a general thinning will relieve the trees, and add greatly to the size of the Figs, which will excel in quality in proportion to the amount of light, heat, and ventilation they receive. Good feeding throughout the growing season is indispensable; and now the days have nearly reached their greatest length, the quantity of diluted liquid that large trees require will be considerable. Our own pot-trees, some 10 feet in height, although firmly rooted in the plunging material, receive about 8 gallons each every other morning. The ammonia arising from this, combined with copious syringing, keeps the foliage in a clean, healthy state, free from red-spider, and it rarely happens that we lose any fruit by premature ripening or dropping. Where pot Figs are not plunged it is a difficult matter to keep them free from scale and red-spider, but an effort must be made to keep these in subjection—the former by the application of strong soap-water with a half-worn painter's brush before the insects extend to the leaves, and the latter by syringing with clear sulphur-water, after the sun is off the house. Trees established in inside borders, and trained over a fixed trellis, should be tied down before the crop begins to ripen, and vigorous growths that are likely to carry the support away from the fruit should be pinched out as the work proceeds. It will be necessary to make additions to the mulching as the feeders appear on the surface, and to keep them there by the application of moisture at short intervals. Ventilate houses in all stages of growth early in the morning, and allow the temperature to rise gradually until the maximum of 80° is attained; reduce in the same way, and finally close on fine afternoons in time for the declining sun to raise the heat to 85° or 90°. *W. Coleman.*

#### MELONS.

In establishments where these delicious and cooling summer and autumn fruits are much esteemed—and where is the place in which they are not so esteemed?—the supply can be considerably increased by planting Melons in frames just vacated by bedding and other plants. The frames can be placed upon a south, west, or even an east border, and a barrow-load of soil, consisting of three parts stiff loam and one of lime rubble, placed in the centre of each light. In planting, presuming the soil to be moderately dry, it should be pressed firmly around each plant; also, when the hillocks necessitate more soil being added thereto, it should be trodden firmly all over the bed, and especially so along the sides and ends of the frames, to prevent the soil coming away from the framework. Should the weather be bright and sunshiny at planting time, shade the plants for a few days until they have re-established themselves, after which it can be discontinued. Plants growing in these frames will require little, if any, water to the roots other than what they receive at planting time to settle the soil about them, bearing in mind that there is no bottom-heat in these frames other than that imparted to the border by the sun. However, the plants will need being syringed every afternoon during bright and sunny weather, putting on air early (half-past 7 o'clock) in the morning, and shutting-up early (from half-past 3 to 4 o'clock), with plenty of atmospheric moisture in the afternoon. Of course the time of putting on and taking off air must be regulated according to the aspect in which the houses, pits, and frames are situate, as also by the condition of the weather, which should be the chief guide. In other departments the stopping, tying, thinning, and otherwise regulating of the shoots, will require due attention. The houses in which the fruits are approaching maturity should be ventilated freely, and a somewhat high and moderately dry atmosphere maintained. In houses in which the fruits have set, ply the syringe freely both ways twice a day during favourable weather, to prevent and keep down red-spider. *H. W. Ward, Longford Castle.*

#### CUCUMBERS.

Plants that have been producing fruit since the middle of March will be considerably benefited by receiving a good top-dressing of three parts loam and one of rotten dung, over which, where the plants are trained to a trellis, a couple of inches of well-decomposed stable-manure may be placed with considerable advantage to the plants, after which the whole should receive a good soaking of tepid water. The shoots should be thinned well out, and re-arranged and syringed twice a day during favourable weather, and shut up sufficiently early in the afternoon to entrap the sun in his western transit. In successional houses, pits, and frames, attend regularly to the stopping, thinning, tying, and arranging of the shoots, and the removing of superfluous and misshapen fruits. Maintain a steady bottom-heat and an equable temperature, so that the plants may not receive any check while the fruits are swelling, which would probably result in the production of deformed fruits—which, moreover, would be tough instead of being crisp. *H. W. Ward, Longford Castle.*

#### PLANT HOUSES.

The time of year has now arrived when, with a favourable change in the weather from the cold we are now experiencing, some of the hardier stove plants will be available for use in the embellishment of conservatories, but before removing them for this purpose to these structures it will be necessary to gradually harden them off by affording more air and a cooler temperature than they have been accustomed to, that they may not suffer from the change which, without adopting precautionary measures of this kind, is sure to be too sudden for their welfare. Not only is it important that they be inured by degrees, but it is equally so that when transferred they should be stood in positions out of reach of draughts or cold currents, such as they would be exposed to if placed in close proximity to the ventilators—a situation most unsuitable for tender subjects like those under notice. Besides being particular in regard to the sites they occupy, the plants will require very careful watering, for if the soil be kept at all wet the roots soon feel it, and are affected injuriously, as the delicate spongioles perish, and these, being the feeders, are a serious loss when leaves and flowers are so dependent on their aid for support. In order to afford more room for the choicer kinds and specimens to grow and develop themselves it will be well at once to remove from amongst them all winter blooming stuff, such as *Eranthemum*, *Sericographis*, *Thyrsacanthus*, *Plumbago rosea*, and the like, which after this succeeds best in pits, where it can be plunged in some gently fermenting material and kept under more immediate control. Gardenias, too, delight in the same kind of treatment, and if pushed on now by being heavily syringed and closed early it will tend greatly to free them from insects, and to get them into condition for blooming at a time when their flowers will be of much value, as they always are at mid-winter. Should the plants have mealy-bug on them there is no safer or better way of ridding them of the pest than by the use of paraffin in the proportion of a wineglassful to 4 gals. of water, which should be constantly stirred when being applied, so as to thoroughly mix the oil that it may be distributed regularly. When syringing it on it is always advisable to lay the plants on their side, in which way the foliage can be effectually wetted above and below without risk of the liquid penetrating the soil, a thing to be avoided when insecticides of this kind have to be resorted to, as without care the roots feel the effects and suffer to a serious extent.

**GREENHOUSES.**—Azaleas that were forced early ought now to have completed their growth and be ready for training, but in doing this the thing is to avoid unnatural stiffness, as, beyond being of moderately regular outline, the less formality there is infused in the shape of the plants the better and more pleasing will they look. Although it is necessary to use some stakes for the tying and support of the main branches they should be hidden as much as possible, as to see the heads of these obtruding themselves spoils all beauty, and the same may be said of many of the trellises, the conspicuousness of which is often such as to be an eyesore. In removing the old stakes, previous to inserting the new ones, it is very important that the decaying ends be withdrawn from the ball of earth, as left there they generate fungus, which parasite spreads at a great rate and does irreparable mischief. The wood best adapted for making stakes that are required to stand long is yellow Baltic deal, as the resinous matter it contains and its hard nature renders it very enduring. For supporting the stems of Lilies and other similar temporary uses the long young shoots of Hazel answer very well, but the strongest, neatest, and best things that can be had for such purposes are small Bamboo rods, that may be obtained at a cheap rate, and which, if taken care of, will last for a great number of years. In regard to Lilies, it has been stated by a writer that the stem-roots are useless, but Nature is generally faultless, and it is very certain that they would not make their appearance in the way they do were they not necessary to some end, which end it is very plain is for the nourishment and support of the flowers, and as this is the case, they should be encouraged as much as possible by having a surfacing of rough fibry loam afforded them, which they will soon lay hold of and form into a perfect mass of feeders, ready to drink up the liquid manure or water whenever either are given. To prolong the season of these serviceable plants to as late a period as they can be had, a portion of the stock should be plunged outdoors in a cool airy position, while others may be gently forwarded under glass; but the more air, light, and sun they get, the sturdier and better will they be. Wherever placed, the shoots require very close watching at this period of their growth, or they soon get crippled by greenfly, which insinuate themselves in the plants among the tender leaves and buds, where they are not observed till much injury is done. A puff of tobacco dust is the safest and easiest remedy to apply, and this as soon as it has done its work may be washed away by a heavy syringing, which will leave all clean and free from deposit. *J. Sheppard.*

## APPOINTMENTS FOR THE ENSUING WEEK.

WEDNESDAY, June 16	{ Royal Botanic Society's Second Summer Exhibition York Gala commences
THURSDAY, June 17	{ Chertsey and District Horticultural Society's Show, at Walton-on-Thames Linnean Society: 8 P.M. Scottish Fairs Society's Show, at Edinburgh
FRIDAY, June 18	{ York Gala closes.

THE daily routine of work and generally the favourable spring are likely, to some extent, to banish from our minds the memory of the wretched year 1879. Not absolutely so by any means—farmers and gardeners suffered too severely for the recollection of the disastrous year ever to be wholly obliterated. We see daily traces of its effects in dead and dying plants, and note its results even more plainly in the poor flowering and small blooms of our trees and shrubs, and in the unusual periods at which some plants are blooming. Such seasons may occur again—there is no telling when or how often. We can do nothing to avert them—can we do ought to mitigate their ill effects? Unquestionably we can, but if we sit wringing our hands and deploring our fate, without striving to profit by the lessons set before us, we court failure and put ourselves beyond the pale of sympathy. Does any intelligent person in the nineteenth century believe that such seasons are sent only to plague and annoy us, to humble our pride and punish our shortcomings? Suppose it to be so—what then? Are we—duly and deservedly punished, it may be—to go in the same way as before?—or are we not rather to profit by the experience of the past? In the case of the farmer ground game bills, modified land-laws, freedom of tenure, increased capital, may, especially the latter, do something towards averting similar catastrophes in the future. But, supposing such beneficial changes to be made, there is still the element of foreign competition on the part of neighbouring or far-off countries blessed with a more propitious climate than our own. That is not likely to diminish; there is every prospect that it will increase. Practical cultivation by what we may call the rule-of-thumb is as perfect as it will can be. It is difficult to imagine anything better in its way than the practice of an experienced and intelligent first-class farmer or gardener. It is hardly likely much further progress can be made in this direction. New ground must be broken, fresh experience sought and obtained. Masters and men must be more thoroughly educated, more carefully trained; and the education and the training must be special. Given a common basis in the shape of a good general education, there must be added to that a special training in natural science—the knowledge of the forms, structure, and manners of living creatures—knowledge of the powers and capabilities of the air, the soil, and the waters and their inhabitants—knowledge of physics and of chemistry. By these means, and these only, as we believe, shall we be able to break out from our old routine into fresh fields and pastures new. In the field of practical horticulture, to take a single illustration, there is no one thing more promising of good results in the future than is the application of the electric light for forcing purposes; but out of the thousands of employers, and the tens of thousands of workmen, what an infinitesimal proportion know anything whatever of the mode of action of electricity. Again, of what avail are the labours of practical entomologists and practical students of fungus pests if cultivators are not educated sufficiently to turn them to good account? The investigations, for instance, into the nature of the Potato disease are at least amply sufficient to afford valuable lessons to the grower as to what means are in his power to mitigate the disasters to which he

is subject, but has he availed himself of them?—does he show any inclination to do so? We fear not.

The education of the masters consists in a good deal of Latin, a smattering of Greek and mathematics—still less modern languages—a little history, and a little geography. The education of the men is in so far better that it includes a great deal more practice, but in all those points which we may look on as the keys to the as yet unopened treasure-houses of natural knowledge, the education of the workers is wholly defective. A thoroughly good practitioner of the present day is in himself no better than many of his predecessors. He is better because he has means and appliances which they had not; but, taking the two men, irrespective of their surroundings, the man of the nineteenth century is no better than his predecessor. This should not be. It is contrary to Nature's law of progress. It is the surest indication of the operation of that other law of Nature—the law of progressive deterioration and ultimate extinction. To promote the onward and prevent the downward progress in agriculture and gardening, the most efficacious means, so far as we know, are to be sought in the study of natural and physical science in all its branches, and its application to the business of life.

"Does it not seem extraordinary" (said Sir JOHN LUBBOCK, the other day) "that in such a country as ours there should be only one school devoted to agriculture; that we should have no forest school, so that the young men who are going to be placed in charge of our great Indian forests have to learn their business in France or Germany; that no instruction is given in agricultural matters in any of the schools and colleges to which our landed proprietors send their sons; and that the education code practically excludes all elementary instruction in the processes of agriculture, the nature of soils, or the care of domestic animals, from our country village schools?"

It does, indeed, seem extraordinary, seeing that we call ourselves a practical people! Of such and similar institutions America boasts scores, Germany has them in abundance, France has them, Belgium makes them portions of her University curriculum. France has quite recently established a Chair of Vegetable Physiology at the Jardin des Plantes, and no one who reads M. DEHÉRAIN'S lecture, the substance of which we hope to lay before our readers, in part at least, can doubt the benefit that will in course of time accrue from such a Professorship. What said Mr. CHURCH the other day, at the Congress held at the Royal Agricultural College at Cirencester, on the occasion of a thoughtful address of Professor TANNER? Was he not right when he said that the bulk of British farmers—and the same remark applies, in its way, to British horticulturists—are entirely ignorant of what has been done for their benefit by Messrs. LAWES and GILBERT at Rothamsted? Was he not right when he pointed to the results obtained in sixty-two experimental stations in Germany, fifteen in Austria-Hungary—127 stations in Europe generally, and asked how much our British cultivators had profited by them? What are our horticultural Societies about? Is it well that their labours should practically be confined to the establishment and conduct of flower shows? The countries we have named are right, and we are wrong. We are tamely letting them get the better of us, and complaining of bad seasons and hard laws, all the time doing next to nothing to meet the altered circumstances. Scientific training in the Universities for those who are to become possessors of estates or managers of property in the future, chairs and classes of agriculture, botany, physiology, physics, chemistry, geology, entomology—all these are wanted, and should be supplied in our great Universities and elsewhere, with special reference to practical needs and requirements. We would by no

means limit such means of instruction to the Universities, but the existing Colleges, or some of them, have revenues which might very profitably be devoted to some such purposes as we have indicated.

For the working classes the Board school or the village school should furnish the basis, not only of a common education, but also such a knowledge of the soil, the air, the waters, the plants and the animals as may be made available in the daily routine of the farm or the garden. We cannot too emphatically repeat our conviction, that progress in gardening and farming in the future depends far more on the results to be got from a thorough training in the various branches of natural knowledge, than it does in any readjustment of land laws or lightening of fiscal regulations. These are, as it were, local accidents—limited in their area, restricted in their range, but Nature is universal, the application of a knowledge of her laws to the business of life is limited only by the finite faculties of man.

—CYPRESSES.—The illustration which we give at p. 735 (fig. 130) was taken from a photograph kindly sent us by M. JOLY, of Paris. It represents a view in the Buena Vista Garden at Verona, and affords a singularly good illustration of the value of this fastigate Cypress as an adjunct to architectural details. The trees in question are 60–70 feet high, and how well they harmonise with the obelisks and other architectural features may be seen at a glance. The effect would, to our thinking, be greatly improved by the intermixture of round-headed trees, such as the Stone Pine, but for the purpose of landmarks, marking out boundaries, forming avenues, and the like, these evergreen fastigate trees have great value. They are very marked features in Italian landscapes, but it is not often that the traveller sees such fine specimens as those now represented.

—RETIREMENT OF MR. DOMINY.—We hear that Mr. DOMINY, whose name has now for forty years been associated with Messrs. VEITCH'S establishments, is about to retire. Few men connected with horticulture have deservedly gained so much esteem and respect from the wide range of people with which his position has brought him in contact, and still fewer have so indelibly fixed their mark upon any family of cultivated plants as has Mr. DOMINY upon Orchids, Nepenthes, &c., by the number of hybrids with which, by his skill and assiduous perseverance, the gardens of this country have become enriched; for it may truly be said, that of the hundreds of collections of these plants which now exist there are none of note that do not contain some or other of the fine things he has raised. In proof of this we need only refer to the two grand plants, *Cattleya exoniensis* × and *Lelia Dominiana* ×, than which it would be difficult to name any amongst the crowd of fine species that surpass them. Others have since followed, and are still following the track in which Mr. DOMINY has been the pioneer, and without detracting in the least from their praiseworthy work, still the name of DOMINY will ever be intimately associated with this, the slowest and most patience-taxing of all operations connected with the gardener's art. Mr. DOMINY retires whilst yet hale, and with his love for horticulture undiminished. May he long live to enjoy the esteem and good wishes of his wide circle of friends and acquaintances.

—HORTICULTURAL CLUB.—A special dinner of this Club was held on Tuesday evening, which was one of the most successful that has as yet been held. Between thirty and forty members and their friends were present. The chair was occupied by Mr. JOHN LEE, who was supported by the Hon. and Rev. J. T. Boscawen, Dr. Hogg, Dr. Masters, Messrs. Veitch, Adams, Osborn, Turner, Wheatstone, Hart, Deal, G. Paul, Rivers, Cutbush, Prince, &c. Amongst the visitors were Messrs. Henri and Maurice Vilmorin of Paris, Mr. Barron of Elvaston, Mr. Rutland, Mr. Laird, and Mr. Sewell. According to the rules of the Club no toasts are given on these occasions, except that of the visitors, which was given by the Chairman, and responded to by Messrs. Henri Vilmorin and Mr. Barron.

FIG. 130.—THE CYPRESSES AT VERONA.

— SCIENCE PRIMERS.—Professor HUXLEY has redeemed his promise of writing a general introductory treatise to the series of excellent Primers published by Messrs. MACMILLAN & Co. It deals clearly and briefly with certain general notions concerning sensations and things, causes and effects, the physical properties of mineral objects, and of living bodies; and lastly, in two short paragraphs, the phenomena of mind as manifested by sensations, emotions, and thoughts, are adverted to.

— DOUBLE CALCEOLARIA.—Mr. BURBIDGE has lately sent us some flowers of Calceolaria presenting an unusual but not unprecedented state of things. An ordinary Calceolaria has four sepals, a two-lipped corolla, two stamens, and a two-celled ovary. From various considerations, which it is not necessary to enter upon here, it may be assumed that this flower is a modification of a regular type, in which the parts of the flower are arranged in fives, nearly as in *Verbascum*. In the present case one, and sometimes four, of the stamens were represented by tubular petals corresponding exactly in position to the stamens usually suppressed, so that here the numerical symmetry of the whorl of stamens was, as it were, restored. A peloria condition of the corolla, in which the irregular bag-shaped flower is replaced by a regular sleeve-like form, is not unusual; nor is it very uncommon to see one or more of the sepals assuming a petal-like guise.

— ACTINIDIA SP.—Messrs. VEITCH send us flowering specimens of an elegant species from Yesso, with slender virgate branches, stalked, ovate, acuminate toothed leaves, thinly setose, and in some cases having a silvery blotch on the upper surface near the apex. The flowers resemble those of a *Philadelphus*. We shall speak further of this on another occasion.

— THE "FLORA OF BRITISH INDIA."—We are glad to announce the issue of the seventh part of this important publication. It is almost wholly occupied with the Rubiaceae, elaborated by Sir JOSEPH HOOKER himself. This great order is arranged for the most part according to the same plan as adopted in the *Genera Plantarum*. Among the plants more especially interesting to gardeners may be mentioned the lovely *Luculia*, represented by *L. gratissima*, a native of the Temperate Eastern Himalaya, and *L. pinceana*, a less known species, from the Khasia Mountains. *Mussaenda*s are remarkable for the increased size and coloration of one or more segments of the calyx. *Ixora* comprises no less than thirty-eight species, the common one cultivated throughout India being *I. coccinea*, of which a yellow variety is stated to be in cultivation. A few new genera are established—viz., *Clarkella*, in honour of one of the coadjutors in the work, Mr. C. B. CLARKE; *Keenanna*, in compliment to Mr. KEENAN, formerly an *employé* at Kew, and who collected largely and well in Cachar. The memory of the late Mr. KINGSTON, also formerly in the service of the Royal Gardens, is kept up by the dedication of an *Ixora*. The small orders *Cornaceae*, including *Benthamia* (referred to *Cornus* as a section), and *Caprifoliaceae*, are the work of Mr. C. B. CLARKE, whose steady help has greatly aided in the more speedy publication of the work.

— RENANTHERA COCCINEA.—The following is an extract from a letter, dated March 8, 1880, from C. FORD, Botanic Gardens, Hong-Kong:—"I am now able to furnish particulars of cultivation which has been most successful, as all our plants are now producing flower-stems. I was at Canton in July, 1878, when I purchased a large quantity of *Renanthera* from the Chinese gardeners at the Fa Tie gardens. It was growing on Mango and other trees; but, with the exception of one piece, which was growing at the very top of a bare branch, it was not flowering. I had the pieces, about 2 feet long, cut off the trees, and when I got back home planted half of the number, five pieces, in one pot, amongst lumps of charcoal and soft bricks. The other half of the plants I had tied to pieces of wood Mango. For several months I kept the whole of the plants under the shade of trees until they had made new roots, and became well established. They were then put in positions of full exposure to sun, where they have remained ever since, and been syringed morning and evening until the cool weather of November set in, when they were kept much drier. After the plants were

placed in the exposed situations they became very yellow, but continued to grow well. They have been very little troubled, and I have no doubt that if the above conditions could be imitated in England, the flowering of this showy Orchid would be insured. The pots in which our plants are growing are 14 inches in diameter, and fairly well filled with roots."

— THE GRAPE LOUSE.—At the forthcoming Botanical and Horticultural Congress, to be held at Brussels, one of the subjects for discussion is as to the measures to be taken to avert the dangers to horticulture threatened by the Convention of Berne.

— The current number of the *Journal of the Verein zur Beförderung des Gartenbaues* of Prussia, after commenting on the prohibition, for all practical purposes, of the export and import of plants owing to the Phylloxera, states that petitions against the enactment of Section 3 of the Convention of Berne have been sent in by Germany and Belgium to the Minister of Foreign Affairs. The French gardeners have protested against it, and Holland and England, it is expected, will do the same. At a meeting of the above Society, held on April 28, it was agreed that a similar petition to that of the Society of *Feronia* and *Flora* of Dresden, should be sent in by them.—Complaints continue to reach us of the oppressive and useless character of these enactments. Some of our nurserymen are compelled to decline orders for Continental countries (although those countries are in places, as the French have it, saturated with Phylloxera), and could not be made worse by the importation of a few *Cycads* or *Orchids*. Only the other day Messrs. CHANTRIER FRÈRES, of Mortefontaine, were debarred from sending some of their new *Crotons* to the exhibition at South Kensington, from the fear that they would not be allowed to take back the plants into France. The stupidity of these laws surpasses belief, considering that a slight breeze, or the assumption by the insect of its winged condition, would make all such laws impotent.

— THE GRAPE LOUSE IN ALGERIA.—M. COSSON, with a view of protecting the vineyards of Algeria from the introduction of the Phylloxera, recommends that the same measures of precaution taken by the Italians should also be taken in the case of Algeria. He advises that the introduction of all living plants, roots, and vegetables, coming from infested districts, should be interdicted. Such precautions will be futile if the conditions for the transport and establishment of the insect prove otherwise favourable, which in this case is doubtful, owing to climatic causes. Meantime the interests of the colony are likely to be seriously interfered with by these over-rigorous and ill-considered edicts.

— NEW ROSE.—Mr. H. BENNETT has handed to us specimens of a pretty new Rose of the *R. polyantha* type, which has been obtained by two or three different French growers, and which has been sold under the name of *Anne Marie de Montravel*. The *Rosa polyantha* in its typical form bears a cluster of small single white flowers. It appears that without seeding, but simply from the influence of good soil and higher cultivation, this has yielded, in more than one case, double flowers, and thus a new variety has been obtained by evolution—for it is said to be permanent. Mr. BENNETT describes the plant as a free-flowering bush of about 18 inches in height, and likely to be an acquisition for bedding. The specimen before us has small leaves, with ovate toothed leaflets, and a corymbose cluster of some half-dozen buds, one of which is expanded into a beautiful pure white sweet-scented Rose a little more than an inch in diameter, and double to the centre. It will, we think, be a charming plant for pot-culture for decorative purposes, as well as for cutting.

— ELWES' MONOGRAPH OF LILIES.—The seventh and concluding part of this beautiful monograph has just been issued. We shall call attention to it more in detail in a future number, but we can but regret that so valuable a contribution to science should have been so speedily brought to an end—assuredly not for lack of matter.

— DOUBLE POMEGRANATES.—A recent number of the *Revue Horticole* contains a beautiful coloured plate of some varieties of this plant, some with double flowers all scarlet, others with scarlet petals edged with white, and others again with a yellow (not

red) calyx and white petals. The varieties in question originated as sports, or bud variations, from a variety called *Legrelle*, which has salmon-red flowers edged with white.

— FLORA OF ALGERIA.—M. COSSON has recently published his lecture on the vegetation of Algeria, which he divides into groups, according to geographical and physical characters, as follows:—Mediterranean near the coast, the mountain region, the region of the high plateaux, consisting of monotonous treeless plains with profusion of *Alfa* (*Stipa tenacissima*); and, lastly, the Sahara or desert region. The botanical characteristics of these several regions are briefly alluded to, and incidental mention made of the excellent results obtained by planting the Australian Gum-tree, especially *Eucalyptus globulus*, in previously unhealthy spots. M. COSSON pronounces strongly against the proposal to convert the Sahara into an inland sea, the disadvantages of which would, in his opinion, greatly outweigh any possible benefit. The destruction of the Date trees, and the formation of stagnant unhealthy morasses, are mentioned among the evils likely to occur if this project were carried out. Well projected railways, and artesian wells in suitable localities, are recommended as preferable means of developing the resources of the country.

— A DRY SPRING.—If a drouthy springtime has many inconveniences for the gardener, it has also some advantages. Spring and early summer as combined in May, is one of the chief planting-out months of the year, and if moist, then the ground is too often cold and unsuited for the reception of tender plants, whilst slugs and the usual ground vermin that prey upon plants are abundant. Last year at this period slugs and snails were legion, and ate up all kinds of tender plants as fast as they were put out, almost driving the unfortunate gardener into a state of madness. Owing to the coldness of the soil, further growth was so much retarded that the effects were seen all through the season. Now, in spite of drought or rather of the drought that existed prior to the recent acceptable but cold showers, all kinds of plants, thanks to abundant sunshine, were robust and forward, and in a condition to grow surpassing that of several previous springtimes. Then, in spite of winds, the sun had warmed the soil deeply, it absorbing its moisture in return, imparting heat, and the young plants have been induced to emit roots with unusual rapidity. In excessively dry soils, where its lumpy condition rendered it fractious and difficult to plant, the drawing of shallow drills, and running therein of a few cans of water, converted it into soil of the softest and most genial kind, and if the cold water for the time lowered the temperature, the warmth in the great body of soil soon raised it again. Dribbled into these watered furrows with the loose surface soil drawn in around to prevent rapid evaporation, the plants have made new roots and become established with rapidity, whilst slugs have been unable, thanks to the exceedingly dry surface, to perambulate and do much mischief. In gardening as in other things, if there are banes there are also antidotes.

— MARKET GARDEN PRICES.—Those growers of market produce who are compelled to commit the disposal of their crops to salesmen doubtless have now another reason to think that their returns are not at all times commensurate with their hopes. Perhaps a few weeks' experience as salesmen of their own things would induce them to be more generally charitable when, as now, on the first twinge of disappointment, they lay the blame upon the wrong shoulders. A few weeks since and there was almost a dearth of green stuff in the market; winter greens had gone by, white Broccoli was scarce, and Cabbages small and of poor quality. Then a price that was eminently satisfactory was obtained for all that was sent to market, whether Spinach, Cabbages, or whatever could be had. Now Spinach will barely fetch 3*d.* per bushel, and Cabbages about 9*d.*, whilst bunched greens are not paying for the labour of pulling, tying, and taking to market. Were it not that many market growers in the metropolitan district have manure contracts which compel them to send to town, it is doubtful whether much of the green crops would get to market; but all hope that if not that day the next may show a remunerative rise in price. It is worthy of remark that these low prices are quoted, not so much as market rates, but are the prices obtainable on the road, as many growers do

not send to market at all, but deal directly with suburban shopkeepers. The point of interest for the public is whether it receives the full benefit of these low prices or not, and if not then the shopkeeper must reap an enormous profit. The great want of London is an abundance of suburban markets, in which the consumer and grower may come into immediate contact.

— SALE OF MR. TURNER'S ORCHIDS.—On Wednesday and Thursday, June 2 and 3, the entire collection of Orchids belonging to W. TURNER, Esq., Over Hall, Winsford, Cheshire, was sold at Stevens' Rooms, the total amount realised being £2082 16s. 6d. The highest price obtained for a single specimen was 95 gs., for *Saccolabium Turneri*, "the only true plant of this marvellous *Saccolabium* in the country." A specimen of *Saccolabium guttatum* Loddigesii realised 60 gs.; *Dendrobium thyrsoiflorum* Walkeria-num, 31 gs.; *Cypripedium Veitchii*, 8½ gs.; *Cattleya Warneri*, 10 gs.; *Dendrobium Schroderi*, 11 gs., 14 gs.; *Cattleya exoniensis*, 30 gs.; *Lælia Brysiana*, 42 gs.; *Vanda suavis* Veitchii, 36 gs.; *Cattleya Wagneri*, 20 gs.; *Aerides Schroderi*, 27 gs., 13 gs.; *Aerides affine roseum*, 20 gs. and 14½ gs.; *Odontoglossum vexillarium*, 22 gs.; *Cattleya Morgani*, 10 gs.; *Cattleya Skinnerii* alba, 22 gs.; *Lælia Williamsii*, 13 gs.; *Cattleya Dowiana*, 15 gs.; *Cypripedium caudatum* roseum, 17 gs.; *Saccolabium giganteum*, 19 gs.; *Masdevallia Harryana*, bull's-blood var., 15½ gs., 6 gs., 11 gs.; *Dendrobium Goldieanum*, the plant that flowered first in this country, 20 gs.; *Cattleya aurea*, 14 gs.; *Saccolabium guttatum* giganteum, 34 gs.; *Lælia purpurata* marginata, £12; *Dendrobium Lowii*, £12; *Odontoglossum vexillarium* roseum, 27 gs.; *Lælia gigantea*, 11 gs.; *Cattleya virginialis*, 17 gs.; *Aerides Thibautianum*, 25 gs.; *Saccolabium guttatum* Dayanum, 10 gs.; *Vanda Denisoniana*, 18 gs.; *Odontoglossum vexillarium* aureum, 38 gs.; *Lælia anceps* alba, 11 gs.; *Cattleya amethystoglossa*, 11 gs.; *Cypripedium Sedeni*, 13 gs.; and *Lycaste Skinneri* alba, 11½ gs.

— HARDY RHODODENDRONS.—The importance of planting only the truly hardy varieties of *Rhododendron*—excepting, of course, in special positions and under special circumstances, in which the tender but high-coloured early-blooming kinds may be found desirable—was never more evident than it is in the present season, the two past severe winters and the unpropitious summer of last year having left their marks upon the plants. This we found very evident on the occasion of a recent visit to the American Nursery at Knap Hill, where the array of blossoms, though sufficient to be pleasing, does not bear comparison with the display of any former year within our memory. The fact is, that owing to the uncongenial circumstances referred to, the flowers of those varieties which most freely partake of the tender blood of *R. arboreum* especially, and of *R. ponticum* in a lesser degree, were either not formed in the autumn, or have been killed or irreparably damaged by the winter frosts, while those in which the blood of *R. catawbiense* preponderates have felt much less the evil influences of either autumn or winter, and are indeed, in many cases, flowering in a very satisfactory manner. The old *R. roseum elegans*, one of the earliest of this breed, stands out to great advantage, its fine foliage and somewhat drooping habit rendering it exceedingly ornamental, while the flowers, if not possessing the large size and the rich spotting of more recent kinds, are at least bright and cheerful in hue, and abundantly profuse. *R. fastuosum flore-pleno* also, another of the older sorts, a double mauve-lilac, and no doubt the best of the doubles, is flowering well, and may therefore be planted with confidence of success. Amongst others of this hardy race which were blooming well we noticed Mrs. Milner, remarkable for its bright, rich, rosy-crimson colour; Mrs. Shuttleworth, a beautiful rosy-crimson with dark spots on a white ground, and remarkable also for its fine semi-drooping habit; Mrs. G. H. W. Heneage, purplish-rose, with a light centre; Mrs. H. Ingersoll, scarlet with bronze blotch, remarkable for its splendid foliage, and its complete hardness; J. Marshall Brooks, rich crimson, thickly dotted with dark spots on a conspicuous bronzy yellow blotch in the upper segment; Sylvio, a fine purplish-rose, with the green or bronze blotch, very fine; and last but not least Sigismund Rucker, one of the grandest *Rhododendrons* ever raised, with fine Laurel-

like foliage untouched by the frost, and immense trusses of well-set flowers, which are of a rich magenta-rose and bear a dense blotch of close set black spots, which render it thoroughly distinct and attractive. Amongst the breaks in colour to be here and there observed, those with pale centres and purple and claret-coloured margins were perhaps the most novel. Some new forms in this way are, as yet, unnamed. The *Azaleas* are, on the whole, less affected by frost than the *Rhododendrons*, and are many of them charming.

— ORCHIDS IN BLOOM.—The following Orchids are in flower at Messrs. JAMES VEITCH & SONS' Royal Exotic Nursery, King's Road, Chelsea:—

- |                                |                                    |

| " <i>suavisimum</i>            |                                    |

— NEW WHITE DECORATIVE PELARGONIUMS.—Two of these, of a specially attractive character, are now flowering in the large collection at Chiswick. They are both new varieties, raised by M. LEMOINE, of Nancy, France. Lucie Lemoine has pure white flowers, that are so destitute of markings in the way of a blotch that there is only a slight pencil flake of deep pink on one of the segments of the flower. Madame Charles Kœnig is of the purest white also, but without the slightest trace of colour. The flowers are about medium-sized, well-formed, and produced in compact and symmetrical trusses. For bouquets these two promise to be invaluable, and especially useful for those used at weddings. There is also a good habit of growth and freedom of bloom: qualities that will commend them to those who make a supply of bouquets a speciality.

— CLAYTONIA ALSINOIDES.—A correspondent sends us this, which he says grows in profusion near Chatsworth and Bakewell. It is not a true native plant. It is very like *C. perfoliata*, but the leaves are not perfoliate.

— LINNEAN SOCIETY: June 3.—Professor ALLMAN, F.R.S., President, in the chair. The only botanical paper read at this meeting was by Mr. GEO. MURRAY, "On the Application of the Results of PRINGSHEIM'S recent Researches on Chlorophyll to the Life of the Lichen." Summarising the results of PRINGSHEIM'S labours, the author considered the suggestion of Dr. VINES, that by the aid of an artificial chlorophyll screen, the protoplasm of fungi might be excited to the decomposition of carbonic acid, and contended that this experiment is proceeding naturally in lichens. He pointed out that in these organisms we have the fungal tissues in the body of the thallus, and the chlorophyll screen in the gonidia, and that light traversing the chlorophyll-containing gonidia—often occurring as a dense layer—excites in the fungal tissues the decomposition of

carbonic acid. In evidence he adduced the plentiful occurrence of starch, or rather lichenin—a substance of the same chemical composition as starch ( $C_{12}H_{10}O_{10}$ ), and formed from it by the action of the free acids of the plant. In conclusion he submitted that this process tended to explain the nature of the consortism of the fungal and algal elements in the lichen, and thus to support the views of SCHWENDENER. In the discussion following, Messrs. CARRUTHERS, BENNETT, and STEWART, and Professors MARTIN, DUNCAN, and GREENE took part.

— LAST WINTER.—In the Champs Elysées, at Paris, it is calculated that more than 10,000 trees and shrubs were killed by the winter; in the Trocadero, 11,000; in the Bois de Boulogne, 50,000 evergreen trees, 30,000 deciduous trees, and 20,000 Conifers.

— RUBUS AUSTRALIS.—That a Blackberry should be recommended for culture as a decorative plant may appear strange to some, but the species under notice is now to be seen in good form at Chiswick, with other specialities of a very interesting character which Mr. BARRON has provided for the instruction and enjoyment of Fellows and their friends. Some plants in pots standing on the brick ledge of one of the houses display themselves to the best advantage; the bright-red fruits, very like in shape to those of our own wild Blackberry, stand out almost erect, while the trailing growth, with runners at short intervals on the stems, hang down and form a leafy fringe of a charming character. This deserves attention as a decorative plant, and some of our floral artists could make excellent use of it. Many gardeners would find it very useful for greenhouse and conservatory decoration, as well as effective in suitable places in the open ground. The fruit is of itself poor, but the uses to which the plant can be put make this a matter of secondary consideration.

— THE BUCKLAND YEW.—Mr. BARRON, of Borrowash, sends us sprays of this now doubly famous Yew, to show the young growth that is being made, and the numerous buds or breaks that are being formed from the old wood. So far well. It must be remembered, however, that this new growth is at the expense of the reserve stored up in the tissues of the plant, and is not derived from without. It is to be hoped that the greatest care will be exercised throughout the summer in attending to the requirements of the tree. Mr. BARRON'S success in moving large and old trees is well known, and he is not to be held responsible for failures that occur from after-neglect, of which we have seen instances.

— THE WEATHER.—General remarks on the weather during the week ending June 7, issued by the Meteorological Office, London:—The weather in Ireland and Scotland has been moderately fine, though with some rain; generally overcast in England, and very showery. Hail fell at some of the western stations on the 7th, and thunder occurred at Brookerborough and Hillington. The temperature was again below the mean in all districts; over the inland and eastern parts of England the deficit was as much as 5° or 6°, and elsewhere from 2° to 4°. The highest of the maximum readings occurred at our north-western stations, and were registered on the 3d, when the thermometer rose to 72° at Barrow-in-Furness, and 71° at Glasgow. The minima were low in all parts of the country, and during the early morning of the 5th the sheltered thermometer went down to about 35° in nearly all parts of Great Britain; at many of our inland stations a sharp ground frost was experienced. The rainfall was less than the mean in "England, N.E.," "England, S.W.," and "Scotland, W.," equal to it in "Ireland, S.," but slightly more than the mean in all other districts. Bright sunshine shows a decided decrease in England, but a slight increase over Ireland and Scotland. The number of hours recorded varies from 69 hours in "Scotland, E.," to 26 hours in the "Midland Counties" and "England, S." The wind was north-easterly during the first two days, northerly on the 3d and 4th, and westerly during the remainder of the period. In force it was generally moderate in the east and south-east, but fresh in the west and north, and on the 4th and 7th blew a fresh gale at Scilly, and a moderate gale on some of the exposed parts of our northern and north-western coasts.

## THE RHODODENDRON SHOWS.

HYDE PARK.—We mentioned recently that Mr. Anthony Waterer, of Knap Hill, had entered into an arrangement with the Office of Works to make an annual exhibition of American plants in the vicinity of Rotten Row. A few days since we paid a visit to the locality, and found that the works at that time in progress had included the formation of two large oval groups of Rhododendrons and two smaller oval groups of hardy Azaleas, while several magnificent standard and other specimen Rhododendrons had been dotted about in appropriate situations to work in with the permanent planting in that portion of the park. The effect was very pleasing, notwithstanding that the plants had had for some six weeks to do battle, fully exposed, to the bitter biting east winds and the morning frosts, which have in most places left their mark on the spring growth of trees and shrubs. The Azaleas, being the earliest to blossom, have suffered most, but even these have not been hit hard enough to prevent them from unfolding masses of beautiful coloured flowers, which needed but the aid of sunshine to give the natural glow to their brilliant tints of yellow, orange, and scarlet.

Entering the park at Albert Gate, the first object which meets the eye is the finest specimen in existence of Rhododendron Scipio, a noble standard plant, with massive head, fully furnished with compact trusses of its showy, deep-rosy, dark-spotted flowers, and, what is of equal importance, viewing it as an ornamental evergreen, furnished with bold, enduring foliage in such a way that the branches are always densely clothed with them. This is balanced by a standard rosy-crimson variety at the opposite corner. Between them, but lying in further from the pathway, is a large group of choice sorts now nicely in bloom, all, or the greater portion of them, being of the well-known Knap Hill catawbiense strain, which has been bred as much for the beauty of the foliage as for the high colour of the flowers, though quality and distinctness of character have also been successfully aimed at. In this bed we particularly noted in fine condition the plum-coloured Old Port, the cherry-red Charles Bagley, the rosy-scarlet Mrs. W. Bovill, the pale-rose Lady Armstrong, the rosy-scarlet dark-spotted Lady Clermont, the rosy-pink dark-eyed Lady Eleanor Cathcart, which the last few dull days had brought out charmingly, almost as delicately as when under canvas; Lord John Russell, pale-rose intensely spotted; the beautiful Mrs. Joseph Shuttleworth, a rosy-crimson with a blotch of black dots on white background, and remarkable for its fine habit as a standard; the dark rosy-purple Nero, the salmony-scarlet moderately spotted Mrs. R. S. Holford, the finely-formed crimson Michael Waterer; Delicatum, one of the best whites; and a grand bush of Mrs. John Clutton, another fine white, described fairly as being the most beautiful hardy white Rhododendron in cultivation, remaining longer in bloom than any other variety.

Advancing eastwards we come to one of the beds of Azaleas, near to which stands a grand bush in perfect health, and profusely decorated with deep rosy-crimson flowers, of *R. Barclayanum*, the original plant now forty years old, the same which was exhibited at the first Regent's Park show. In the same vicinity are dense bush specimens, 6 feet high, and broad in proportion, of *Album grandiflorum*, a pleasing blush flower, and of *Delicatum*, the latter being the finest plant of its kind.

On the north side of the "row" we come to a magnificent standard of Lady Eleanor Cathcart, with a clear stem of about 3 feet, and a dense spreading head 12 feet across, which will by this time be a mass of flowers. Further on is a specimen of *Roseum elegans* (the true old sort so named), which is a model of what a standard Rhododendron should be, having a sufficiently sturdy stem, a dense well-balanced head some 8 feet high, with a somewhat dependent habit in the branches which renders it exceedingly effective, while its abundant clusters of warm, rosy-lilac flowers, with just enough green visible to afford a good contrast, leave nothing to be desired. This, though an old variety, is always a telling one on account of its excellent habit—the specimen now under note is in truth a perfect picture. A large standard *Delicatum* in the same vicinity was not yet open, and will carry on the bloom till the end of the Rhododendron season.

Here comes in another showy bed of Azaleas, and a little further on a second charming bed of Rhododendrons, in which several of the sorts already noted

are repeated. In addition we noted grand trusses of the purplish-crimson *H. W. Sargent*; a very telling plant of *Purity*, one of the best of the whites, with a faint yellow eye, and here blooming exceptionally fine; *Othello*, a purplish-crimson; *Fastuosum flore-pleno*, the best of the double-flowered sorts, a deep mauve with faint greenish eye, very effective and desirable; *Stella*, pale rose with intense blotch, associated with such fine sorts as *Michael Waterer*, *Mrs. Joseph Shuttleworth*, *Old Port*, *Mrs. Holford*, &c. These and many others were blooming most profusely and effectively in the open glades between the permanent trees and shrubberies, notwithstanding the long interval of bleak nipping weather to which they have been exposed ever since their removal from the peat beds of Knap Hill.

SLOANE STREET.—Messrs. John Waterer & Sons, of the Bagshot Nurseries, hold an exhibition of

variety which is still indispensable in all good collections; its warm lilac tint, its conspicuous greenish spotting, and its prettily frilled margin, all combine to render it one of the most pleasing of its race, besides which it is of excellent habit, is one of the hardiest of the hardy sorts, has fine healthy foliage, and is a most constant and abundant bloomer. There were some good trusses of *Michael Waterer*, with its finely shaped, rich crimson faintly spotted flowers; *Sir H. Mildmay*, bright rose-crimson; *William Ewart Gladstone*, a large-flowered pale rose; *James Mason*, rosy-pink with pale centre; *Baron Schröder*, plum colour, with yellowish blotch; the old *Roseum elegans*, always and everywhere good; and *Delicatissimum*, a very effective blush-white. Small plants of *Lady Olive Guinness* were rather telling, from their dark spotting on pure white ground, but the small flowers, small trusses, and narrow foliage are objectionable. Many other sorts

FIG. 131.—MASDEVALLIA BELLA. (SEE P. 760.)

American plants this year in Cadogan Place, Sloane Street, where a spacious tent in three spans has been erected for its accommodation. At the time of our visit it consisted entirely of Rhododendrons, which were fairly in bloom, and will be fully so during the ensuing week. The space is neatly laid out in irregular beds; and, as is always the case when a considerable number of these fine flowering shrubs are brought together at this season of the year, the show is a very pleasing one. The centre of attraction, and occupying the place of honour near the centre of the tent, is a fine well-flowered bush of Lady Eleanor Cathcart, which, as is well known, is always attractive when flowered under canvas; the late dull weather had, moreover, favoured the production of that delicate tinge of pink which is so captivating under these conditions, and which contrasts so well with the dark chocolate blotch of the upper segment. Very few of the varieties were named, so that we can individually mention but few of the sorts which were shown. One of the best and most pleasing was the old *Everestianum*, a

will no doubt be open now, and the collection will be well worth a visit during the ensuing week.

REGENT'S PARK.—Mr. Anthony Waterer, of Knap Hill, has of late years held an annual exhibition of American plants in the gardens of the Royal Botanic Society. The show of this year is a very good one, despite the cruel injuries suffered by many plants during the last unpropitious season, and it will be in good condition throughout the next week. It occupies the usual ground, the laying out of which, as many of our readers know, is very effective on account of the irregularity of its surface. When we saw it we found abundant use for our note-book, some of the entries in which we will here transcribe. Always on the look-out for something new, our attention was first taken by a splendid novelty named *Mrs. F. Hankey*, which has fine, broad, bold foliage, and large compact trusses of flowers, which are of a deep salmon-pink, somewhat paler in the centre, with a conspicuous blotch of black spots on the upper seg-

ment. It is a beautiful variety, and a very decided advance on Lady Eleanor Cathcart, some two or three shades deeper in colour. Of other sorts which we found in admirable condition and specially noticeable, there were Alexander Dancer, having fine bold flower-trusses and good foliage, the flowers bright rose with a magenta flush, and small white blotch dotted with black, a grand flower; Mrs. R. S. Holford, very bright and distinct, a salmony-scarlet, with dotted blotch of medium density, fine leaf and bold truss; Lucretia, a noble variety, with bold trusses of flowers which are pale in the centre, with a margin of magenta-rose, and yellowish

condition were Mrs. J. Shuttleworth; The Moor, a deep dull crimson with dark spots; Mrs. W. Bovill, Sir J. Sebright, purple with bronzy blotch; the grand old Everestianum, and Michael Waterer. We noted a very attractive plant of the thoroughly good variety named Helen Waterer, one of the Bagshot seedlings, which has a bold leaf, and produces good trusses of white-centred flowers with a deep scarlet-crimson edge, a decided improvement, by which the older and long-favoured Alarm is superseded. Madame Carvalho, a good white sort, was just opening; and there were others in abundance coming forward to keep up the display. *M.*

branches were not visible until after the January hoar frosts, and chiefly after the sap had begun to flow; whilst it is further evidenced that the damage was of recent origin, in the fact that many branches put forth leaves and bloom, and only collapsed when the rot induced by the frost injuries spread through the wood. All the trees in question are growing on a south-west slope, the soil beneath being elevated into 6 feet rounded beds, on which are planted Goosecherry bushes and Violets, that all excessive surface-water can get off quickly, and that the soil is naturally well drained and by no means waterlogged. On the higher portion there is a considerable substratum of gravel, and here the damage is just as great as lower down, where the soil is stiffer and has an admixture of clay.

FIG. 132.—MASDEVALLIA BELLA: NAT. SIZE. (SEE P. 760.)

spots in the upper segment, the leaf also remarkably good; Vauban, scarcely out, but with a noble truss of soft reddish-lilac flowers, having a very conspicuous blotch of bronzy-yellow spots on the upper part; Lady Clermont, a very superior variety, producing fine trusses of deep rosy-crimson flowers with a conspicuous dark blotch; Lady Armstrong, a pale rosy-magenta with light blotch marked with small black spots, very distinct and beautiful; Delicatum, one of the best of the whites, having good foliage, and large white flowers marked with a large trifid blotch of greenish-yellow spots; and Mrs. H. Ingersoll, a distinct sort, of fine habit, with bright rosy-scarlet flowers, having a well-marked green blotch, which renders it very attractive. Other fine sorts in good

### Home Correspondence.

**Dead Apple Trees.**—"C. L.'s" note upon this topic (p. 724) does not give a satisfactory reason for the severe injuries to the many Apple trees I recently mentioned. Why should all the King Pippins in a row, for instance, be nearly killed whilst Keswick Codlins within a few feet are unharmed? Or the same may be said of rows of Wellingtons half dead, and rows of other kinds quite unharmed. When the injury is entirely limited to certain few kinds, and these injured more or less without exception, and certain other kinds have entirely escaped, it is obvious that the injured sorts must be tender and more amenable to the excessive changes of temperature. It is worthy of note that the peculiar fractures on the injured

All these facts point to the conclusion that the intense frost was the cause of the injuries referred to. *Alex. Dean.*

**The Herb Sorrel.**—The author of "Notes from a Lancashire Garden" would find this a great addition to his herb-beds. It is one of the first to come in spring, and is most useful in various ways, imparting a relish to the "Potage à la bonne femme," called by some "Dutchwoman's Soup"—though we never saw it in Holland. It gives a piquant flavour when used as sauce for a *fricandeau* when Spinach is wanting, though this dish, so popular abroad, is not much appreciated here, possibly because the butchers always cut the veal the wrong way of the grain, making it appear somewhat unsightly. Sorrel, though mentioned by Culpeper in his *Complete Herbal*,

and therein commended, does not seem ever to have been a popular British potherb. It is not named by Chaucer, Spenser, Shakespeare, or Herrick, I think, though some of these authors have done justice to "Costmaries," and Spenser gives a long list of sweet herbs in the "Fate of the Butterflie;" neither does it occur in his "Garden of Proserpine," where noxious plants are named. Drayton and John Skelton pass it by, though the latter has a charming tribute to Marjoram, addressed to a lady named "Margary Wentworth." In "the Schoolmistress' Garden" Shenstone found no place for our Sorrel, though the kingly Basil was there, and "pun-provoking Thyme." We gather that in the days of Drayton Costmary took the same place that Borage does now. "Costmary that so likes the cup;" but the "fine sour relish," attributed to another kind of Sorrel (the oxalis) by Culpeper, may still be enjoyed by those who include a bed of the common kind in their *potager*. From the days of Solomon, who wrote of "the Hyssop that springeth out of the wall," to those of poor Kirke White, commemorating "the humble Rosemary," herbs have not been the least interesting department of the kitchen-garden. Has John Clare, the Northamptonshire poet, included the Sorrel in his "Cottage Garden"? We cannot remember, but think he has not. *H. M. E., June 7.*

**Odontoglossum vexillarium.**—We have here in bloom what we consider one of the finest forms of this Orchid. Most persons display partiality to their own bairns, but in this instance, we think, the said partiality may be excused, the plant under notice being so immeasurably superior to any of its fellows—over thirty of them, and amongst which are many truly fine varieties. The length of flower is exactly 5 inches; greatest width across sepals,  $3\frac{3}{4}$  inches; width of lip, 3 inches; lip very square, with corners only rounded. The size of the flowers is less remarkable than their intense depth and brilliancy of colouring, which far surpasses the vexillarium illustrated in Warner's work, or of any plant of the kind, I believe, hitherto exhibited. It would have given me great pleasure to have sent the plant to the Royal Horticultural Society's show this week, could I have found a safe mode of transit for the precious beauty. It may perhaps interest some of your readers to hear that we have the beautiful *Utricularia montana* in flower with over ninety spikes on one plant, and about 500 flowers; this piece, with another now filling a 6-inch basket, has been grown in three years from half-a-dozen bulbs, or rather bladders. *Utricularia Endresii* promises to behave equally well; last June or July we received a precious morsel from the Messrs. Veitch which is now throwing up sixteen spikes. *Fred. Yates, Higher Fenscoteles.*

**Chickens in the Garden.**—Gardeners, as a rule, turn with disgust at the thought of allowing fowls to run in the kitchen garden. Unfortunately the feathered roosters give too much reason for this feeling. They are never satisfied with a gardener's labour. No bed is raked fine enough, no seed properly sown, no young plants in their right places, but they must rake again in their own fashion, or redistribute the seed, or scratch out the plants that they might be replanted more to their taste. All this is very annoying, and leads to the conviction that bulls are not more out of place in a china shop than are fowls in the garden. But little chickens do not exhibit the inherent vices of their race in early youth, and display only the virtues—few enough, perhaps—that are peculiar to the fowl family. They run about, doing no harm, their little bodies and feet leave no impression on the soil, they do not scratch, seem never dissatisfied, but find pleasure only in the pursuit of food, or in basking in a warm corner in the sun's rays. Whilst in this stage of infantile innocence the little creatures can in the garden perform a vast amount of good; their little eyes spy out and little bills gather myriads of insects that are not easily visible to the human eye. Perhaps owing to the very minute nature of the food they gather, perhaps arising from their characteristic voracity, they are almost always roaming about and doing useful work. Meanwhile, the clucking and anxious mother may be kept secure in a bottomed coop which, removed here and there in the garden, will allow the chickens to enjoy fresh feeding ground each day. *A. D.*

**Rhododendrons.**—I daresay you will excuse a few more words about Rhododendrons in this their special season. Among Anthony Waterer's plants in the Botanic Gardens, Regent's Park, I found, in spite of the drawbacks of an unfavourable season, several things worthy of notice. There were many of novel character and colour among the new and unnamed seedlings. In the other varieties Mrs. F. Hankey seemed specially good and distinct (salmon, with a very dark and conspicuous eye); J. Marshall Brooks, deservedly famous for large bronze eye on a rich crimson ground; and Mrs. Holford, of a colour which catches the eye at once among a hundred others. Many later kinds have still to open; but

Lady Eleanor Cathcart was in full beauty. It is singular how long this variety has maintained its superiority. Taken all in all, there is still no more effective Rhododendron. I have heard that the seedling plant was sixteen years old before flowering, and it is always shy of bloom when small. To my fancy, one of the parents must have been *R. maximum*. When are we to have a double crimson Rhododendron in the style of *R. fastuosum flore-pleno*? *J. H. Mangles, Valewood, Haslemere.*

**Orchids at the Manchester Show.**—Having been one of the judges at the above show I decidedly demur to the all-round attack made upon everybody having to do with the show, as managers, reporters, or judges. I cannot understand why "Exhibitor" should object to the award for fifteen Orchids merely because the collection contained three plants of *Cattleya Mossie*. With all due respect to the opinion of "Exhibitor," I say they were distinct varieties (although not obliged to be so), and, like every plant in the collection, superbly grown and bloomed. The judges looked upon them with minds entirely unbiassed, and with very different eyes from "Exhibitor," who, I presume was a competitor in the same class, and as a natural consequence failed entirely to see his neighbours' good points. The judges moreover had valid reasons for awarding the premier prize to that collection. Surely *Vanda*, *Aerides*, and *Phalenopsis* are not essential elements in a collection now, when we have such a multitude of magnificent genera and species in cultivation. As regards the award in the class for nine Orchids, we did feel a little difficulty—not as regards the plants, for as a collection they were vastly superior to the other competing collections in that class; but our difficulty was entirely with regard to the ugly square tubs in which they were exhibited, and the glaring way in which the specimens had been made up. When, however, we came to compare notes, and take stock of the other collections, we found that others had been at the same game, but being older hands at the business had done their work with greater neatness. So, considering the superiority of the plants, we came to the conclusion that it would never do either to place them 3d, or to disqualify them merely because the gardener in charge of the collection was not quite so well skilled in the art of making up. The fact is, nearly every collection in the show contained made-up plants to a greater or lesser extent. The practice is general—always was, and always will be, in defiance of all that can either be said or written against it. As regards the remarks of "Another Disappointed Exhibitor," in your last issue, it strikes me that I was awarded premier prizes for large collections of Orchids at the London shows before he had learned his alphabet. I would also advise these "exhibitors" to think seriously before attacking judges again. They would also do well to read, and study carefully, Luke, chap. vi., verse 41. *Robert Bullen.*

**The Cuckoo.**—This bird is mentioned in a most unfavourable way by Beaumont and Fletcher: see "The Two Noble Kinsmen." The stanza runs thus:

"The crow, the slanderous cuckoo, nor  
The hoding raven, nor enough hoar,  
Nor chattering pie,  
May on our bride-house perch or sing,  
Or with them any discord bring,  
But from it fly!"

—*Song.*

**Messrs. Paul & Son's Protest against the Rose Judging at the Crystal Palace.**—There are some things said and done which it would be most considerate towards those from whom they proceed to treat with that silence which is often more expressive than words, simply letting them sink into the limbo that entombs so much of human littleness. Of such is Messrs. Paul & Son's protest. But the world is filled with people, many of whom jump at the conclusion that "silence gives consent," so much so that if a man were charged for a breach of promise to marry his deceased wife's great-grandmother they would vote him guilty if he said nothing in defence. It would be difficult to set a limit to the vagaries that disappointed exhibitors sometimes indulge in. But Messrs. Paul have hit upon an original method of letting people know their imaginary grievance. Amongst the numbers who read their advertisement, and who did not see the competing collections, many will naturally think that Messrs. Paul had some reason to complain, or they would not have taken such an unusual step. If, as Messrs. Paul say, "their collection was in every way superior to that placed before it," then the decision can only be accounted for in one of two ways, either through incapacity or dishonesty on the part of the judges. Out of this there is no escape. The question then is, Who are right—Messrs. Paul, or the judges? As one of those who judged the collections, it would be out of place for me to say much about fitness for the office; but, I may perhaps be allowed to remark that all the three judges have had as much experience in growing, showing, and judging plants,

Roses included, as have Messrs. Paul, and hold their honour quite as high. The decision was unanimous and unhesitating, a close scrutiny of every plant in both collections confirming the impression we collectively entertained at first sight. It is strange that Messrs. Paul should have their equanimity so disturbed by being beaten on this occasion, for it is really nothing new to them. I find, on referring to the reports of the shows for the last three years—1877, 1878, and 1879—that they have shown thirteen collections of pot Roses against Mr. Turner, and he has beaten them in eleven out of the thirteen; and on the two occasions on which he failed to vanquish them the competition was not with large plants, and in many cases the awards were made by different sets of judges. This I know has nothing to do with the present case, and if Messrs. Paul's plants had been the best on this occasion they would most undoubtedly have been put first; and I only mention it to remind Messrs. Paul that the judges at the last Crystal Palace show are not the only ones who have committed the grave offence of placing their plants second. I have seen collections shown by Messrs. Paul much nearer Mr. Turner's than the one in question. To their unwarrantable assertions my reply is, that either Messrs. Paul cannot see the merits of other growers' plants when opposed to their own, or they have made the charge against the decision of the judges knowing it to be groundless. *One of the Judges.*

**English Gardeners.**—In the interests of a deserving body of men, *bona fide* gardeners out of situations, may I be allowed to make a few remarks? That the supply is in excess of the demand the numbers of good men out of place fully testifies, but why is this? Their number certainly has increased immensely of late years, but so have gardening establishments, both in number and size. It certainly is not German competition, which as yet is inconsiderable, neither is it that gardeners are longer-lived than formerly; but I have an idea, which I am at present unwilling to ventilate too freely, that the practice (now happily on the decrease) of obtaining gardeners through the medium of a nursery is at the root of the evil. Now, to alleviate this evil, could not gardeners form an association having certain rules, and a standard of merit for its members, and having a recognised centre, where a gentleman requiring the services of a gardener (there are gardeners and gardeners) might have his wants supplied without the question of self-interest as in the nurseryman's case? I think the old adage, that "Heaven helps those who help themselves," would hold good in this case, and should be glad of the opinion of practical men on the matter; as I think it a disgrace to the craft that a man whose heart is in his work, who was possibly born and bred in a garden, and hopes to die in one, should go to the wall, while another, who a few years ago was possibly a common labourer, but who through a lucky chance has been enabled to give his nurseryman a good order, should be helped over the stile. *J. Wm. Chapman.*

**Falling Peach-Leaves, and Other Matters.**—I do not recollect writing any article on this subject (see p. 724). My Peach-leaves are now, and always have been, very healthy. I imagine the leaves spoken of have suffered from gum, which is the worst disease a Peach tree can be afflicted with. I may say, in conclusion, that Peaches out-of-doors are almost *nil*. I regret to say Pears and Apples are a great failure. The Cherries are abundant, but I fear stoning time. Plums are moderate. Gooseberries and Currants of all kinds are most abundant. Strawberries are a great crop, but want rain. Raspberries are a fair crop. Asparagus weak, and much injured by the frost; I have made new beds of this and Seakale. Peas (King's) wonderfully bloomed. I have fine plants of Empress of Prussia and British Queen. Mr. Shilling's new ridge Cucumber gives me capital plants—better than Stockwood and Pain's. He had better advertise! Every seed germinated. *W. F. Ratchiffe.*

**Phloxes for a Rockery.**—The first Phlox in flower in spring is *P. verna*. It is very gay where it does well, but runs so much as to be troublesome: it is a good plan to collect several well-rooted runners early in autumn, and bunch them together so as to obtain a compact mass of flowers. *P. stolonifera*, of the same colour as *P. verna*, and often confused with it, has a close habit; *P. procumbens*, with pale lavender flowers, grows weakly with me. Of the mossy section, including *P. subulata*, *P. setacea*, *P. frondosa* (three names which seem to me to be interchangeable), perhaps *P. Nelsoni* is the best; it has flowered unusually well this year, making a sheet of pure white, quite hiding the leaves. It is quite hardy here on rockeries, but dies every winter on the level borders; my only objection to it is the large space it claims for itself when out of flower. Several of the Aldborough varieties of this class are very good, but there is a disappointing sameness amongst others, which seem to me to differ only in name. *P. divari-*

cata is a very elegant and desirable plant; it has been in flower all May, and is now being succeeded by *P. ovata*, one of the best of all rockery plants, recommended by its large crimson flowers and neat compact habit. It does well also in the level border. All these Phloxes grow readily from cuttings. *C. Holley Dod, Edge Hall, Malpas.*

Reports of Societies.

Royal Horticultural: June 8, 9, 10, and 11.—It is some years now since the leading Horticultural Society had a June show so representative in character as the one which was opened under such unfavourable circumstances as regards the weather on Tuesday last. The large marquee has often looked better filled than it did on this occasion, and some departments have been better represented; but, judging the show as a whole, it was impossible to come to any other conclusion than that a more complete display of flowers and fruits, considering the unfavourable season, it would be difficult to get together. The stove and greenhouse flowering plants, as well as the fine-foliaged plants and Ferns, were of better quality than usual—the leading groups of the former, shown by Mr. Tudgey, gr. to T. F. Greswolde Williams, Esq.; of fine foliaged plants, shown by Mr. Rann, gr. to J. Warren, Esq., Handcross Park, and Mr. Tudgey; and of Ferns, by Mr. Rann and Mr. Hudson, gr. to H. J. Atkinson, Esq., Gunnersbury House, Acton, being especially deserving of praise. For Azaleas and Roses the season was rather late, consequently there was but a thin show of both, and their absence in quantity and defect in quality was sensibly felt. The groups of miscellaneous plants, which always add much to the general effect, were more numerous than ever, and, generally speaking, of good quality. The display of fruit was extremely good all round, and especially so in the case of Grapes, which were very plentiful, and of remarkably good quality.

STOVE AND GREENHOUSE PLANTS.

The first three classes in the schedule were devoted to stove and greenhouse plants in flower, and in the open class for twelve the 1st prize was easily won by T. F. G. Williams, Esq., Henwick Grange, Worcester (Mr. E. Tudgey, gr.), who showed *Ixora Williamsii*, about 4 feet in height, very fresh, well flowered, and clothed with ample foliage down to the pot; a splendidly flowered example of *Erica elegans*, about 4 feet through, and superbly bloomed; a well flowered *Clerodendron Balfourianum*, about 4 feet high and the same in diameter, with its flowers very evenly distributed; a grand *Dracophyllum gracile*, of about the same width, covered with a profusion of fine large flowers; a first-rate *Erica ventricosa magnifica*, *Erica Parmentieri rosea*, a splendid bush from 5 to 6 feet through, but only partially in bloom; *Pimelea decussata*, *Erica Cavendishiana*, *Azalea Brilliant*, well flowered and very fresh; and a small plant of *Aphelexis macrantha rosea*. Messrs. T. Jackson & Son, Kingston-on-Thames, came in 2d with a group of smaller specimens, the best of which were examples of *Darwinia tulipifera*, *Azalea Souvenir du Prince Albert*, well flowered, and very bright; *Francisea calycina major*, *Statice Patcherii*—an admirable specimen; *Erica affinis*, and *Aphelexis macrantha rosea*, &c. The 3d prize went to Messrs. J. Peed & Sons, Roupell Park Nurseries, Norwood Road, who had larger plants than those of Messrs. Jackson, but showing the effects of age. The best examples were of Jackson's *Crimson Azalea*, *Anthurium Scherzerianum*, nearly a yard through, with fine large spathes; *Erica Cavendishiana*, young, well flowered, and very fresh; *Epacris Eclipse*, &c. In the nurserymen's class for eight there were only two competitors—Messrs. B. Peed & Son, Lower Streatham, and Messrs. T. Jackson & Son, who took the honours in the order named. In the 1st prize group were large and well-flowered bushes of *Dracophyllum gracile*, *Erica Cavendishiana*, *Rondeletia speciosa*, *Anthurium Scherzerianum*, and *Allamanda grandiflora*, &c. The Messrs. Jackson's plants were a nice fresh lot, included amongst them being a particularly good *Darwinia tulipifera*, a yard in diameter, in fine health, and carrying a good crop of large and well-coloured blooms. A specimen of *D. fuchsoides* made a good match for the preceding, and a plant of *Azalea Extranei* carried a nice head of bloom. In the corresponding class for amateurs there was a better competition. Here again Mr. Tudgey took the lead with a grand lot, consisting of a beautifully bloomed *Dipladenia hybrida*, *Clerodendron Balfourianum*, *Erica ventricosa magnifica*, *Azalea Distinction*, *Dracophyllum gracile*, *Aphelexis macrantha rosea* and *purpurea*, &c. Mrs. Torr, Garbrand Hall, Fwell (Mr. Child, gr.), came in 2d, with a fine healthy bush of *Erica depressa*, *Azalea Iveryana* and *Duchesse Adelaide de Nassau*, both of good size and well bloomed; *Darwinia tulipifera*, *Dracophyllum gracile*, and *Clerodendron Balfourianum*, &c. J. Warren, Esq., Handcross Park (Mr. C. Rann, gr.), was 3d, with amongst others a splendidly bloomed *Statice profusa*, about 1 yard through. We should state here that Mr. Rann's plants met with an accident on the road from which some of them suffered severely. The other competitors were D. Martineau, Esq., Clapham Park (Mr. J. Weston, gr.) and Louisa Lady Goldsmid (Mr. G. Wheeler, gr.). Of Azaleas, as before observed, the display was a poor one. The nurserymen's class for ten brought no com-

petition, and Mr. Turner was the only exhibitor of fifteen. These, which took the 1st prize, were small in size but well bloomed, very fresh and bright. *Bernard Andrea*, semi-double rose; *Bernard Andrea alba*, semi-double white; *Souvenir du Prince Albert*, double, pale rose, margined and slashed with white; *Cordon Bleu*, rosy-purple; *Moins*, Thibaut, a very fine salmon-red; and *Bon pour le Commerce*, were especially good in quality. There were only two exhibitors of eight in the amateurs' class—Mrs. Torr and D. Martineau, Esq., but these were so poor that a 3d prize and an extra only were awarded. Heaths, on the contrary, were a little better represented than they have been for the last year or two. For eight, distinct, Mr. Tudgey was a good 1st, with capital specimens of *E. Cavendishiana*, *mutabilis*, *ventricosa superba*, *tricolor speciosa*, *Massoni major*, *Candolleana*, *ventricosa magnifica*, &c.; and Messrs. Jackson & Son were 2d, with fresh and nicely bloomed young plants of *E. affine*, *ampullacea*, *obovata*, *ventricosa breviflora*, *ventricosa grandiflora*, *Cavendishiana*, &c. Messrs. B. Peed & Son were 3d.

ORCHIDS.

With the exception of a charming group of *Odontoglossums* from Mr. Bull, the competing collections in the four classes for Orchids were shown in a long tent leading from the Council-room to the large marquee, and made a very creditable display. In the open class for fifteen the 1st prize was awarded to F. Whitbourn, Esq., Loxford Hall (Mr. J. Douglas, gr.); and the 2d to Mr. H. James, Castle Nursery, Lower Norwood; but it was the opinion of some good judges that these positions should have been reversed. Be that as it may, both collections were of considerable merit. Mr. Douglas had specimens of *Cypripedium caudatum roseum*, *Odontoglossum vexillarium*, *O. Roezlii album*, *Epidendrum vitellinum majus*, *Dendrobium thyrsoiflorum*, with ten spikes; *Cattleya Warneri*, with ten flowers; *Denvaldia Dalhousianum*, with sixteen spikes; *Masdevallia Harryana*, *Laelia cinnabarina*, *Cypripedium villosum*, *Dendrobium Bensonae*, and *Orechis foliosa*, with sixteen strong spikes. Mr. James had a good mass of *Cattleya Mossiae*, *Vanda suavis*, with three spikes; *Oncidium sessile*, *Odontoglossum citrosimum roseum*, *O. Alexandre*, *O. vexillarium*, *Epidendrum prismatocarpum*, *Dendrobium suavisimum*, good; *Laelia purpurata*, with eight flowers; *Anguloa Clowesii*, and *Epidendrum vitellinum majus*. The Duke of Richmond and Gordon, Goodwood (Mr. Rutland, gr.), who came in 3d, had a large *Oncidium sphacelatum* with eleven spikes, *Odontoglossum Alexandre* with six spikes, *Cattleya Mossiae*, *Dendrobium nobile*, *D. thyrsoiflorum*, &c. In the corresponding class, open only to amateurs, the 1st prize was won easily by C. Hart, Esq., Beaufort House, Leyland Road, Lee (Mr. Reeves, gr.), who had fresh, healthy, and nicely flowered specimens of the typical variety of *Masdevallia Harryana*, and also of the Bull's blood variety, *Odontoglossum Alexandre*, *Cypripedium niveum*, *Masdevallia Veitchiana*, *Odontoglossum Hallii* with five good spikes, *O. cirrosum*, with four good spikes; *O. vexillarium*, and *Epidendrum vitellinum majus*, a fine pair. Mrs. Torr (Mr. Child, gr.) was 2d with *Aceris Fieldingii*, with six well branched spikes; *Cypripedium Stonei*, *Odontoglossum citrosimum*, *Dendrobium nobile*, *Masdevallia Veitchiana*, &c.; 3d, F. Whitbourn, Esq. (Mr. J. Douglas, gr.), with another but smaller plant of *Dendrobium Dalhousianum*, *D. thyrsoiflorum*, *Odontoglossum Alexandre*, &c. Mr. B. S. Williams had no difficulty in securing the highest award in the nurserymen's class for ten, his group consisting of *Cattleya Warneri* with ten flowers, *Orechis foliosa* with about two dozen spikes, a fine pan of *Cypripedium barbatum superbum*, *Odontoglossum Alexandre* with a dozen good spikes, *Masdevallia Harryana cœrulescens*, *Odontoglossum vexillarium* with seven spikes, *Cattleya Mossiae superba* with two dozen blooms, a fine mass of *Epidendrum vitellinum majus*, *Cypripedium niveum*, and *Masdevallia Veitchiana*. Next to Mr. Williams came Messrs. T. Jackson & Son, who had amongst others a large example of *Dendrobium thyrsoiflorum*, *Calanthe veratrifolia* with a dozen spikes, *Oncidium stelligerum*, *Odontoglossum vexillarium*, &c. Mr. H. James was 3d. For a group of *Odontoglossums* Mr. William Bull was 1st, and F. A. Philbrick, Esq., Q.C. (Mr. Heims, gr.), 2d, the former showing a charming collection tastefully blended with Maidenhair Ferns, and comprising a number of plants of *Odontoglossum Alexandre*, *O. vexillarium*, *O. cordatum*, *O. vexillarium*, and *O. Phalaenopsis*. Mr. Philbrick's plants numbered a dozen in all, the species staged being *O. Alexandre*, *O. vexillarium*, and *O. citrosimum*.

NEW PLANTS.

The class for twelve new plants sent out since 1877 brought out two exhibitors—Mr. W. Bull and J. Warren, Esq., Handcross Park (gr., Mr. Rann). Mr. Bull obtained the 1st prize with *Sarracenia atropurpurea*, with long erect narrow green pitchers, the lid of which is ovate acuminate, dull red in colour; *Plectocoma himalayensis*, a Calamus-like Palm, with loosely disposed pinnate leaves and spiny stems; *Cyphomandra argentea*, a shrub or small tree with large thick coriaceous obovate leaves, suffused with a milky hue—a rather coarse but effective plant; *Oncidium Gardnerianum*, a relatively small-flowered species, with stalked sepals and petals of a rounded form, undulate at the margins, rich brown in colour, with a yellow edge, the lip transversely oblong, rounded, crisped, bright yellow, with a brown edge; *Ceratostamia fusco-viridis*, with thick leathery pinnate leaves, the segments lanceolate acuminate, of a smoky or ashy-green colour; *Dieffenbachia Leopoldii*, a noble form, with deep velvety-green leaves with a central white band (the plant is figured in the *Gard. Chron.* 1878, ix., p. 439); *Encephalartos Frederici Guiljelmi*, a noble Cycad with narrow leaves pinnately cut, the segments

narrow, lanceolate, bluish-grey in colour; *Juncus zebra*, the banded Rush, figured in *Gard. Chron.* 1877, vol. vii., p. 399; *Thrinax babadense*, a dwarf Fan Palm with shining green leaves; *Gymnotheca Raddiana*, with pinnate leaves and lanceolate undulate segments; *Philodendron Carderi*, a scandent Aroid, with ovate-acuminate leaves, dark green and velvety, with red setose stalks and red under-surface—a very beautiful species; *Sarracenia flava ornata*, a bold variety of *S. flava*, with erect, long, funnel-shaped green pitchers and broad ovate lids. Mr. Rann's plants comprised amongst others *Aralia filicifolia*, with spotted stalks and pinnately lobed leaves, the segments linear, lance-shaped, irregularly pinnatisect; *Croton Prince of Wales*, with linear, undulate leaves variegated with yellow; *Pteris umbrosa cristata*, *Croton Martii*, with broad obovate-acuminate leaves, green spotted, and blotched with yellow; *Dracena Robinsoniana*, with oblanceolate leaves, green striped with pink; *Gleichenia dicarpa longipinnata*, &c.

The prizes in the class for the same number of new plants not in commerce were competed for by Mr. W. Bull and Mr. B. S. Williams. Mr. Bull secured the 1st prize for a collection containing the elegant finely cut *Davallia Fijiensis*, figured in the *Gardeners' Chronicle*, vol. ix., 1878, p. 440; *Anthurium insigne*, the handsome Aroid, figured at p. 365, vol. vi., 1876; *Selaginella involvens variegata*, a dwarf tufted species like a bird's nest, the tips of the otherwise dark green fronds marked with a silver variegation; *Croton insignis*, *Spirea Aruncus var. astilboides*, a dwarf-growing *Spirea*, with ternately compound foliage and dense branching panicles of white flowers, the lateral branches of the panicle as thick as a swan's-quill, obtuse at the ends, and thickly covered with flowers; *Illium religiosum variegatum*, a shrub with leathery oblong-acute leaves prettily variegated with white; *Dieffenbachia regina*, a form with bold, cordate-oblong leaves with green ground blotched with yellow, one of the finest of its class (see p. 745); *Vriesia Falkenbergii*, a Bromeliad of tufted habit, narrow green decurved leaves, and a central spike some 10–12 inches high with two-ranked closely-set boat-shaped bracts, scarlet at the base, greenish-yellow above—a very striking plant; *Rhopaloblasta princeps*, a Palm with broadly oblong-obtuse pinnate leaves, the segments narrow—a handsome Palm; *Aralia splendens*, with long pinnate shining green leaves, the segments lanceolate; *Dieffenbachia rex* with large oblong-acuminate leaves, green speckled with yellow spots; *Adiantum aneitense*, with dark green bipinnate fronds, the ultimate segments small, cuneate-obovate, serrulate.

Mr. Williams, who obtained the 2d prize, showed *Dieffenbachia latimaculata*, with large lanceolate acuminate leaves with a broad green disc blotched with yellow; *Croton Dodgsonii* with long linear lanceolate leaves with stripes of golden-yellow in the centre and along the margins, and with intervening bands of green; *Aralia nobilis*, a Theophrasta-like plant with closely packed bold foliage, the leaves oblong obovate-acuminate, undulate at the margins; *Asplenium Baptistei*, with black-green pinnate fronds, the segments oblong lanceolate, comb-toothed at the margins; *Calamus densus*, *Nepenthes Dornmanniana*, with cylindrical red-spotted pitchers; *Sansevieria aureo-marginata*, with narrow oblanceolate leaves with central and marginal green stripes and dirty yellow intervening disc; *Croton Rodeckianus*, with linear leaves blotched with pink and yellow; *Wallichia zebra*, a Palm with spotted leaf-stalks and pinnate leaves, the segments broad and wedge-shaped; *Azophila tomentosa*; *Cocos Baptistei*, with yellow-brown rachis and pinnate leaves with narrow lance-shaped segments; and *Dracena Mrs. Turner*.

MR. BULL'S PRIZES.—Classes A. to D. of the special prizes included the competition for Mr. Bull's cups. Mr. Bull, the spirited introducer of so many fine new plants during the last dozen or more years, not finding it convenient to grow specimen plants himself, but preferring to devote himself to the getting up of a stock, offers yearly prizes to those who grow plants of his introduction into specimens. As these competitions necessarily include some of the finest and most interesting of newly introduced plants, the result is specially interesting, as indicating what are likely to be the most important commercial plants of the future. In Class A., for twelve new plants sent out since 1877 (amateurs), J. Warren, Esq., Handcross Park (gr., Mr. Rann), was adjudged the 1st prize. This exhibitor showed *Croton Williamsii*, with broad obovate acute leaves, blotched with pink and yellow, finely coloured; *Croton princeps*, with ovate lanceolate leaves, spotted with yellow and pink; C. Hendersoni, a well grown plant with obovate yellow foliage; C. roseo-pictus; C. Challenger, *Lomaria Dalgairnsiae*, *Kentia Wendlandiana*, a Palm with bold pinnate leaves, the segments broadly lanceolate erect at the edges; *Panax laciniatus*, with deep green pinnate foliage, the segments remote, lanceolate, toothed; *Dracena vivicans*, with linear striped leaves; *Aralia filicifolia*, previously noted, and *Dracena Robinsoniana*. The Rev. Canon Bridges (gr., Mr. Penfold) obtained the 2d prize for *Croton Hendersoni*; C. rex, with lanceolate leaves with a central stripe; *Panax laciniatus*, *Gymnogramma Mertensii dobroydenis*, *Alouasia Johnstoni*, a curious Aroid with pale maroon-coloured spotted prickly stems and hastate leaves; *Kentia Wendlandiana*, previously noted; *Aralia filicifolia*, *Davidsonia pruriens*, the handsome interruptedly pinnate-leaved plant figured in *Gard. Chron.* 1877, vii., 819; *Dieffenbachia Cheloni*, and other plants elsewhere commented on.

Class B. comprised plants of a similar character, competed for by nurserymen. Mr. B. S. Williams obtained the 1st prize: his collection comprised *Croton Williamsii*, C. Hendersoni, C. Cheloni, with linear tortuous leaves, dark green, with a central orange stripe; *Calyptromma Swartzii*, *Dracena Robinsoniana*, *Lastrea aristata variegata*, *Cibotium pruinatum*, *Encephalartos Frederici*

Guilclmii, *Kentia Wendlandiana*, *Dracena Goldicana*, *Aralia filicifolia*. The plants in classes C. and D., for private growers and nurserymen respectively who have not previously won one of Mr. Bull's cups, were necessarily of a similar character to those previously mentioned. In class C., for private growers, Sir J. H. H. Amory, M.P., Knighthay's Court, Tiverton (gr., Mr. Schway), was 1st with *Cycas siamensis*, a Cycad in the way of *C. circinalis*, with narrow mucronate pinnae of a pale glaucous green hue; *Dieffenbachia Leopoldii*, elsewhere noted; *Carludovica Drudei*, figured in *Gard. Chron.* 1877, vol. viii., p. 714; *Ixora Cheloni*, with orange flowers; and other plants enumerated in other classes. The 2d prize was awarded to Mrs. G. Pease, Woodside, Darlington (gr., Mr. McIntyre). This exhibitor showed *Dieffenbachia Shuttleworthii*, *Curcuma Wallisii*, *Aralia gracillima*, and other plants mentioned under previous classes. In class D., for nurserymen, the 1st prize went to Messrs. Osborn, of Fulham, for *Dieffenbachia splendens*, *Asparagus plumosus*, the very beautiful feathery *Asparagus* figured at p. 710, (for the illustration of which we are indebted to Mr. Bull); and other plants detailed under other heads.

#### FINE-FOLIAGED PLANTS AND FERNS.

A class for eight fine-foliaged plants, confined to amateurs, brought out four competitors, and two of them, Mr. C. Rann and Mr. Tudgey, showed grand collections. The two sets of plants, which were very evenly matched, occupied the mound at the western end of the large tent (which Mr. Wills has so often decorated in his tasteful style), and combined made an imposing display of noble tropical foliage. After much consideration the judges awarded the 1st prize to Mr. Rann, and the 2d to Mr. Tudgey. Mr. Rann's collection consisted of a magnificent specimen of *Cycas revoluta* with a spread of fronds of about 10 feet in diameter, and in perfect condition; *Croton interruptus*, about 6 feet high and 5 feet in diameter, well clothed with highly-coloured foliage down to the pot; a very handsome young plant of *Croton Andreanus*, a noble leaved species; large and beautiful specimens of *Areca sapida*, *Pritchardia pacifica*, and *Encephalartos villosus*. Mr. Tudgey had an immense and very perfect example of *Lantana borbonica*, and smaller but very fine specimens of *Pritchardia pacifica*, *Stevensonia grandifolia*, *Cycas circinalis*, especially fine; *C. revoluta*, *Geonoma gracilis*, *Croton pictus*, about 5 feet by 4 feet, and in first-rate condition; and *Cordyline indivisa*. The Rev. Canon Bridges, Beddington House, Beddington (Mr. T. N. Penfold, gr.) was 3d with a good but much smaller group.

The amateur's class for six stove or greenhouse Ferns was an exceedingly good one, and deserving of all praise. The 1st prize was awarded to Mr. Rann, whose chief specimen was a plant of *Gleichenia microphylla*, about 8 feet in diameter; his others being also fine specimens of *Gleichenia Mendelli*, from 5 to 6 feet through; *Davallia Mooreana*, a grand specimen; *Gleichenia rupestris glaucescens*, *Dicksonia antarctica*, and *Cyathea dealbata*. H. J. Atkinson, Esq. (Mr. Hudson, gr.), was an exceedingly good 2d, with a large *Dicksonia antarctica*; a large and very perfect example of *Thamnopteris australasica*, *Davallia bullata*, from 4 to 5 feet over, a fine mass of fronds; *Gleichenia semivestita*, about 4 feet in diameter; a very large *Davallia Mooreana*, and *Gleichenia flabellata*. Mrs. Torr (Mr. Child, gr.), who was 3d, had a handsome piece of *Todea superba*, with a spread of fronds about 4 feet over; a splendidly-grown plant of *Microlepia hirta cristata*, and a fine *Gleichenia Mendelli*, &c. F. A. Steel, Esq., Littlecot, Streatham Common (Mr. H. Brown, gr.), also showed an exceedingly fine specimen of *Davallia Mooreana*, about 7 feet over; and well-grown examples of *Adiantum cuneatum* and *A. farleyense*; and in another group, staged by Mr. Tudgey, we noted a striking plant of *Cibotium regale*, as well as a telling specimen of *Gleichenia dichotoma*. Mr. B. S. Williams was the only trade exhibitor, and he received 1st prize for good examples of *Cyathea Burkei*, *Dicksonia antarctica*, *Thamnopteris Nidus*, *Adiantum gracillimum*, *Gleichenia flabellata*, and G. Mendelli.

#### ROSES, PELARGONIUMS, &c.

Messrs. Paul & Son, Cheshunt, were the only exhibitors in classes for twenty and nine Roses respectively, and to them the 1st prize was in each case awarded. The nine specimens formed a group of large and well-flowered plants, but with a preponderance of rose-coloured varieties. The sorts shown were *Céline Forestier*, the best plant of all; *Anna Alexieff*, *Marie Rady*, *Horace Vernet*, *Juno*, *Madame Thérèse Levet*, *Madame Alice Dureau*, *Maréchal Vaillant*, and *Madame Margottin*. The small plants were well bloomed and in good condition. The amateurs' class for six brought out about the finest lot of plants that we have seen exhibited by a non-professional grower. These came from G. P. Hawley, Esq., Aldin House, Slough, who took the 1st prize, beating Mr. J. Tranter, Upper Assenden, Henley-on-Thames. Mr. Hawley's plants were well grown, neatly trained, and well bloomed, and measured from 2 to 3 feet in diameter. The competition with show Pelargoniums was confined to H. Lattle, Esq., Hillingdon Place, Uxbridge (Mr. Wiggins, gr.), Mr. Turner, and Messrs. J. Peed & Sons, the former having the largest and best grown plants, which secured the 1st prize. His specimens measured about 3 feet in diameter, well clothed with good foliage and profusely bloomed, the varieties being *Princess of Denmark*, *Hebe*, *Pericles*, *Brigitine*, *Snowflake*, *Hermit*, *Prince Leopold*, *Caribrel*, and *Rob Roy*. Mr. Turner's specimens, as usual, bore flowers of the very highest quality, and very pure in colour, the blooms of such varieties as Mrs. A. Matthews, *Scottish Chieftain*, *Prince Leopold*, *Ruth*, *Troubadour*, &c., being especially rich. Mr. Lattle, who was the only grower

of Fancy Pelargoniums represented, was awarded the 1st prize for nine as good plants as have been shown for some time, each specimen measuring from 2 to 3 feet in diameter, and most profusely bloomed. The sorts were *The Shah*, *East Lynne*, *Mirella*, *Princess Teck*, *Lucy*, *Juliet*, *Mrs. Hart*, *Ellen Beck*, and *Mrs. Graham*. The class for twenty tuberous Begonias brought out the best competition that has yet been seen of this fine decorative flower. Messrs. J. Laing & Son won the 1st prize, but they were very closely run by Mr. H. Coppin, *The Rose Nursery*, Shirley, Croydon, who had a well-grown lot of plants, but the varieties were not so good all round nor so numerous as in the Stanstead collection. Messrs. Hooper & Co., Covent Garden, were a good 3d. Messrs. Osborn & Sons and F. Whitbourn, Esq. (Mr. Douglas, gr.), competed in the class for a group of not less than thirty hardy herbaceous plants, and the prizes were awarded in the order named, though we think the decision should have been the other way, for while the Fulham group certainly contained the greatest number of species and varieties, it did not exhibit anything like such good cultivation as Mr. Douglas', and certainly was by no means so attractive. The display of *Aquilegia*, *Pyrethrus*, &c., in the last-named group was unexceptionally good, and proved a singularly attractive feature. Cut blooms of hardy flowers were well shown both by Messrs. Hooper & Co. and Messrs. Osborn & Sons; and cut blooms of Pansies of very superior quality came from Mr. Hooper and Mr. Cutley, of Bath; Messrs. Downie & Laird, of Edinburgh; Messrs. James Cocker & Sons, of Aberdeen; and other growers.

#### GROUPS OF PLANTS.

Contrary to the usual rule the three classes for groups of plants arranged for effect brought out not only a good competition, but an exceedingly fine display of really well-grown objects. Remarkably fine indeed was the group of fine-foliaged plants, occupying not more than 300 square feet, which won the 1st prize in that class for Messrs. Hooper & Co., of Covent Garden. The plants on the whole were larger than those shown by the other competitors, of first-rate quality, great variety, and tastefully set up. H. J. Atkinson, Esq., Acton (Mr. Hudson, gr.), was a good 2d, showing a fine lot of stuff, and a few especially good specimens. The 3d prize went to Mr. Rann, who was strong on the point of cultivation but wanting in variety—a result we believe of the accident before alluded to. Messrs. Osborn & Sons and the Rev. Canon Bridges also made a good bid for fame in the same class. An even better competition than the last was a corresponding one for fine-foliaged and flowering plants combined, which brought out seven competitors and an unusually good display of plants of a miscellaneous character. The schedule stated that the competition was for a "group of miscellaneous plants, arranged for effect, and occupying a space not exceeding 300 square feet;" but, singular to relate, the judges gave the 1st prize, not to a group of miscellaneous plants effectively arranged, but to a model of a fernery arranged in the natural style, by Mr. A. Blake, 55, Britannia Road, Fulham. This, we think, was an error of judgment, of which the other competitors have good reason to complain, for the execution of such designs by all or any of the exhibitors could never have been intended by the framers of the schedule. Mr. Blake's work was very good in its way, but was not a group of miscellaneous plants, and should have had a special award as an independent exhibit. The 2d prize was awarded to Messrs. John Laing & Co., who put up a very fine lot of plants, mostly fine-foliaged, of excellent quality, and tastefully grouped. Equal 3d prizes were awarded to E. O. Coope, Esq., M.P., *The Rocketts*, Brentwood (gr., Mr. J. Ford), and Mr. G. Aldous, South Kensington; but both deserved a better fate. Mr. Aldous' group was strong in the usual market style of flowering plants and handsome young Palms, and was set up in a much more elegant and pleasing manner than this exhibitor usually adopts. Mr. Ford's group was remarkable for the great variety of plants which it contained, and for the good all-round cultivation which it displayed, so different to the mean stuff too often seen in such groups. Large and to some extent very effective groups were also shown by Mr. Rann, Messrs. J. Peed & Sons, and J. A. Causton, Esq., *Lodgenore*, West Dulwich (Mr. J. R. Bird, gr.). Mr. B. S. Williams was the only exhibitor of a similarly sized group of plants in bloom, and to him the 1st prize was awarded. Stove and greenhouse plants and Orchids were represented by a rich and varied assortment.

#### MISCELLANEOUS.

The miscellaneous class was of an unusually extensive character, and embraced a great variety of subjects, without which a horticultural exhibition now-a-days would be considered very incomplete. Gold Medals were awarded to Mr. William Bull for a very striking group of fine-foliaged and flowering plants, new, rare, or remarkable for some feature of interest or usefulness, and including the singularly curious *Masdevallia bella* (see pp. 756, 757), the triangular segments of the flowers of which are prolonged into long narrow tails spotted with brown, and have a small white lip; to the General Horticultural Company (John Wills), Limited, for a magnificent collection of *Dracenas*, superbly grown, and including all the best of the new varieties; and to Messrs. James Carter & Co., of High Holborn, for an immense group of *Coleuses*, consisting, we should imagine, of almost every variety in cultivation, represented in a small state. To Mr. B. S. Williams a Silver Flora Medal was awarded for a fine group of plants; and Mrs. Watson, Redles, Isleworth (Mr. James, gr.), received a similar award for an admirable group of Herbaceous *Calceolarias*. Silver Banksian Medals were accorded to Messrs. Wm. Cutbush & Sons for a large group of stove and greenhouse

flowering and fine-foliaged plants; to J. Brand, Esq., Bedford Hill House, Balham (Mr. Rapley, gr.), for a large and excellent display of herbaceous *Calceolarias*; to Mr. Boller, of Kensal New Town, for a large assortment of small Cactuses and other succulent plants; and to Mr. Pearson, the Nurseries, Chilwell, Notts, for a most admirable display of Zonal Pelargoniums, all of his own raising, and including many unnamed but most promising varieties. Messrs. H. Lane & Son received a Silver-gilt Banksian Medal for a group of one dozen admirably-grown, columnar-trained Ives in pots; and Messrs. Kelway & Son, Langport, a Silver Flora Medal for a large collection of cut blooms of *Pyrethrus*—a remarkably fine set of flowers; and Messrs. F. & A. Smith, of Dulwich, a Bronze Flora Medal for a nice collection of decorative Pelargoniums.

#### FRUIT AND VEGETABLES.

Doubtless the wise proviso added in the schedule—that instead of compelling exhibitors to allow their fruits and vegetables to remain on the tables the full four days the show was open, as heretofore, it was on this occasion permitted them to remove all such exhibits on the evening of the second day—had its weight in producing such a remarkably fine display of these garden products as greeted the judges on Tuesday. The remark was both general and true that for the time of the year the exhibits were a grand lot indeed. Pine-apples were perhaps the most indifferently represented; the fruits were of medium size, but nicely ripened, yet few in number, the class for two fruits having no award, the two fruits entered being unworthy, and two others not entered were unable to take an award. For one Queen Pine there was the fullest entry, the 1st place being taken by L. J. Baker, Esq., Haydon Hall, Pinner (Mr. J. Fry, gr.), with a moderately good fruit; Mr. T. Bailey, of Shardloes, Amersham, coming 2d; and Lord Somers, Eastnor Castle (Mr. Coleman, gr.), 3d. In the Smooth Cayenne class there was but one entry, and a 2d prize only was awarded. This was shown by Mr. Sage, of Ashridge Park. For one fruit of any other variety, J. Ellice, Esq., Poulett Lodge, Twickenham (Mr. Bates, gr.), was 1st with a moderate *Charlotte Rothschild*; and Mr. Breese, of Congleton, was 2d with a small *Montserrat*. Grapes were a very fine feature, not less than 162 bunches being staged in fifty-four lots. Of these twelve were Black Hamburgs, the 1st prize in this class going to T. Barnes, Esq., *The Quinta*, Chirk (Mr. Loudon, gr.), who had large, handsome, even bunches, the berries black and well finished. This lot was well ahead of all the others in the class. Next came the Duke of Marlborough, *Blenheim Park*, Woodstock (Mr. Crump, gr.), with very pretty medium bunches, the berries large and well coloured; and the 3d place fell to Mrs. Tristram, Fowey Court, Liphook (Mr. P. Edwards, gr.), whose bunches were good and the berries as black as Sloes, but rather lacking size. The class for any other black Grape brought fewer entries, the best lot being the three fine and superbly coloured bunches of *Burchard's Prince*, shown by Mr. Loudon. These were of the true *Prince* form, and were most meritorious examples of a Grape not generally grown. W. Spottiswoode, Esq., Coombe Bank, Sevenoaks (Mr. Bolton, gr.), with neat bunches of *Black Prince*, was placed 2d; and the 3d place was taken by Mr. Miles, of Wycombe Abbey Gardens, with very fair bunches of *Muscat Hamburg*. As usual, *Muscat of Alexandria* at this time of year, though shown largely, was deficient in colour and ripeness. The bunches shown by Mr. Edwards, though very good and fairly coloured, lacked size and form. Another month was needed in all cases to supply the desired amber tint. Mr. J. Loudon took the 2d prize, and Mr. Coleman was 3d. The strongest Grape class was that for three bunches of any other kind, not less than twenty-four lots being staged. In this class the 1st prize was easily taken by the Marchioness Camden, *Bayham Abbey*, Sussex (Mr. W. Johnson, gr.), with some really grand bunches of *Buckland Sweetwater*, every berry large and finely coloured. The 2d prize went to the Earl of Leven and Melville, *Fulmer*, Slough (Mr. Mowbray, gr.), with smaller bunches of the same variety; and Col. L. Lindsay, M.P., *Lockinge Park*, Wantage (Mr. J. Atkins, gr.), was 3d with admirably finished bunches of *Foster's Seedling*. Not less than fourteen dishes of Peaches were shown, and the major portion rich in colour, telling of sunshine during the past month. Mr. Coleman took 1st place with a dish of the *Abec*, a large rich-coloured fruit, and evidently a valuable early kind. The second dish, a very fair example of *Royal George*, came from Mr. W. Bones, *Havering Park*, Romford; and Mr. Crump was 3d with excellent fruit of *Barrington*. In the Nectarine class Mr. Miles was 1st with a good dish of *Elruge*, brilliant with colour. J. Norris, Esq., *Castle Hill*, Bletchingly (Mr. G. Holliday, gr.), was 2d, with *Lord Napier*; and Dr. Fuller, *Shoreham* (Mr. J. Nash, gr.), was 3d with the same variety. Strawberries were large and good, but not abundantly shown. In the class for three varieties, Mr. Norman, of the Gardens, Hatfield Park, was 1st, with good examples of *Sir C. Napier*, *Sir J. Paxton*, and *President*. T. C. Hardwick, Esq., *Tonbridge* (Mr. Goldsmith, gr.), was 2d, with huge *James Veitch*, good *Sir J. Paxton*, and very moderate *President*. There was a better competition in the single dish class, *Major Stone* (Mr. J. Mortimer, gr.) coming 1st with a grand lot, named *President* but evidently *Sir Joseph Paxton*; Mr. James, of Redles, *Isleworth*, was 2d, with good *Sir Joseph*; and Mr. Gibson, *Halstead Place Gardens*, *Sevenoaks*, was 3d, with the same kind. Cherries as usual found their best examples in those sent by Mr. Miles, who was 1st in the class for two dishes with *Black Circassian* and *Governor Wood*; Mr. Woodbridge being 2d, with *Belle d'Orléans* and *Frogmore Bigarreau*. With a single dish of the *Black Circassian* Mr. Miles was also 1st, and Mr. Woodbridge was placed 2d. The class for one Melon brought not less than thirty-one fruits of all sorts

and sizes, and as the judges tasted all their office was not an enviable one. With a fruit named Blenheim Orange, oval in shape, medium size, prettily netted and having scarlet flesh of the most luscious taste and flavour we have ever met with. Mr. Crump was placed 1st, J. H. Rolis, Esq., The Hendre, Monmouth (Mr. Coomber, gr.), was 2d, with Hendre Seedling, a scarlet-flesh kind; and Mr. Norman, of Hatfield, was 3d, with large fruit of Read's Scarlet-flesh. Tomatoes were remarkably good, the dish of Stamfordian staged by Captain D. Wingfield, Orsett Hall, Romford (Mr. Iggulden, gr.), were as handsome and large as desirable; the 2d prize went to Mr. Crump, for a pretty lot of Excelsior, and J. T. Friend, Esq., Margate (Mr. Miller, gr.), was 3d, with smaller samples of the same kind. Big and sutured samples of 'Trophy' were passed over for handsome if smaller fruits.

The single class for ten dishes of vegetables brought ten collections, all remarkably even and good, not a coarse dish being seen amongst the entire lot. Here Mr. Miles well maintained his old prestige as a grower of high-class vegetables, with a collection admirable at every point. He had a fine bundle of Asparagus, excellent London White Cauliflower, large Stamfordian Tomatoes, pretty Snowball Turnips, handsome Fete's Superb Cucumbers, good Lapstone Potatoes, with Canadian Wonder Beans, Nantes Horn Carrots, White Naples Onions, and Unique Peas, all first-rate. Mr. Iggulden was 2d with a nice lot, only just inferior, that included good Unique Peas, Munich Early Turnips, Trophy Tomatoes, Woodstock Kidney Potatoes (a handsome dish), and fine Cauliflowers. The 3d place was taken by Mr. Chittleburgh, gr. to Col. Rous, M.P., Weststead House, Norwich.

A good competition resulted from the special prizes offered by Messrs. Sutton & Sons, seedsmen, Reading, for Peas, Melons, and Cucumbers. With four dishes of Peas, half a peck each, Mr. Iggulden was 1st with capital samples, just fit for table, of Sutton's Kingleader and Bijou, and Laxton's William I. and Unique. In a small collection it is unfortunate that both these kinds should be included, as the pods are exactly alike, one being but the dwarf form of the other. Mr. Bellis, gr. to Major Thoytt, of Sulhamstead House, Reading, was 2d, with very good Blue Peter, Kingleader, Emerald Gem, and William I.; the 3d prize going to Mr. J. Clarke, gr. to Lord Hastings, Melton Constable. A fine lot of pods, staged by Mr. Chittleburgh, was about a week past their best. Cucumbers and Melons grouped do not make a taking combination on the show-table, as it is not easy thus to judge them on their merits. In the class for two brace of Cucumbers and two couples of Melons, Mr. Goldsmith, of Tunbridge, was 1st, with Cucumbers Telegraph and Duke of Connaught, and Melons Hero of Bath and Read's Scarlet-flesh. Mr. Lockie, gr. to Lord Otho Fitzgerald, Oakley Court, Windsor, was 2d, with same kinds of Cucumbers and Hero of Bath and Royal Botanic Prize Melons. Mr. Crump was 3d, with Tender and True and Duke of Connaught Cucumbers, and Earl of Beaconsfield and Victory of Bath Melons.

HORTICULTURAL APPLIANCES, &c.

In this department there did not seem to be so great a variety as usual, and but few awards were made. The highest was a Silver-gilt Flora Medal, given to Messrs. Foster & Pearson, Horticultural Builders, Beeston, Notts, who showed a well designed and substantially built span-roofed plant-house, and a couple of span-roofed frames ventilated on a novel yet simple system, that should take the fancy of amateur and professional alike. Mr. W. Richardson, the Meadow Foundry Co., Mansfield, was awarded a Silver Rankian for a new throttle valve with removable bored part; and Mr. T. Clarke, Twickenham, a medal of similar value for the Patent Excelsior Lawn Mower. Mr. J. C. Fox received a Silver Flora Medal for summer-houses, of which every frequenter of South Kensington knows him to be a good designer and builder; and Messrs. J. J. Thomas & Co., 362, Edgware Road, were Highly Commended for an extensive display of wirework of all kinds applicable to horticultural purposes.

SCIENTIFIC COMMITTEE.—Arthur Grote, Esq., in the chair.

The Secretariat.—The Rev. Geo. Henslow, the newly-appointed Secretary to the committee, entered upon the duties of his office.

Plants Exhibited.—Mr. Lynch, Curator of the Cambridge Botanic Garden, exhibited cut specimens of the following plants, and made some comments on them:—*Aretotis arborescens*, a Centaurea-like plant, from South Africa, of which it is believed that the Cambridge Botanic Garden possesses the only living example. It is a perennial Composite, about 2 feet in height, covered with grey shaggy pubescence, pinnately-lobed leaves and flower-heads, some 2 inches across, with a short scarious involucre, and numerous pink rays. Mr. Lynch is about to try it as a bedding plant. *Lathyrus Sibthorpii*, *Eremurus spectabilis*, *Syringa persica laciniata*, in flower; *Pyrus coronaria*, a handsome late flowering species—the Apple-like flowers have a delicious perfume of Violets; *Cytisus Laburnum involutum* in flower; the Sun Hemp of India—*Crotalaria juncea*; and specimens of *Cuscuta reflexa*, to show its effect upon the stems of a *Pelargonium*.

Pitcher on Broccoli.—Mr. W. G. Smith exhibited a young Broccoli plant with a pitcher developed on a stout peduncle in place of the usual raceme of flowers. The example was received with native Cornish specimens of *Arum italicum*, from Mr. W. Roberts, of Penzance.

Australian Insect.—Specimens were sent by Mr. Protheroe of an insect (*Coccus?*) supposed to have been imported from Australia to Cape Town, and which were referred to Mr. MacLachlan for examination and report.

Malformed Peach Blossom.—A malformed Peach blossom, formed on the shoot of the year, was referred to Dr. Masters for examination and report.

Malformed Fritillary.—Rev. George Henslow showed drawings of flowers of Fritillaries, in which one side of the flower, including the perianth and stamens on that side of the flower, were arrested in development; thus showing an approximation to what occurs in *Pontedera*, various *Commelynaeae*, &c.

Double *Calceolaria*.—Dr. Masters showed drawings by Mr. W. G. Smith of malformed *Calceolarias* received from Mr. Burbridge, and in which super-numerary stamens were developed in the shape of petal-like tubes or bags enclosed within the true corolla.

Hybrid *Ismenes*.—Col. Trevor Clark showed two hybrids, one a cross between *Elisena longipetala* and *Ismene calathina*, the result of which was a plant identical with *Ismene dellexa*; the other a cross between *Ismene Amances* and *I. calathina*, the result of which was a plant known formerly as the "sulphurescent mule." A First-class Certificate had been awarded by the Floral Committee to the latter plant.

*Lilium nitidum*.—A plant was shown under this name, and referred to Mr. Elwes for examination and report.

*Phylloxera*.—Some conversation took place on this subject, in the course of which Dr. Masters alluded to the steps taken by the Society, as well as by various foreign societies, to obtain some modification of the needlessly oppressive regulations adopted by the Berne Convention.

FLORAL COMMITTEE.—Dr. Denny in the chair. The number of subjects brought under notice of the committee was considerable, but few were considered worthy of certificates. The most notable object was a magnificent specimen of *Cattleya gigas* with forty flowers, no doubt the finest plant of this species which has yet been seen; it was recommended to the Council as being worthy the award of a Gold Medal, and reflected the highest credit on Mr. Spyers, gr. to Sir Trevor Lawrence, by whom it was grown and exhibited. Messrs. Veitch & Sons, of Chelsea, showed one or two interesting forms of Japanese Maples, but they were scarcely sufficiently developed, and the request was made that they might be sent again later on. The same exhibitors had a pretty variegated Japanese Oak, *Quercus cuspidata argenteo-variegata*, in the form of small plants with neat ovate cuspidate leaves, freely edged with creamy white; they were considered too small to justify an opinion on their merits, the more so as the hardness of the plants had not yet been fully tested. Mr. King, gr., Wray Park, Reigate, again exhibited his fringed *Coleus*, *Adelaide Baxter*, a very pretty sort, with the midrib and veins crimson on a maroon ground, and the marginal teeth edged with green; it was much admired, and is no doubt a variety that will give satisfaction to those who take an interest in this now numerous family. Several interesting varieties of *Nerium Oleander* were contributed from the gardens at Chiswick, some of which deserved a better fate than to have been sent back undecorated. A large number of so-called decorative *Pelargoniums*, from Messrs. F. & A. Smith and others, were staged, but the few justifiable awards made to this class of varieties earlier in the season appears to have stimulated growers to bring out all the ragged and bizarre-looking flowers they can muster, so long as they are exuberant of blossom.

NEW PLANTS CERTIFICATED.

M. V. Lemoine, of Nancy, received a First-class Certificate for double-flowered Ivy-leaved *Pelargonium Mons. Dubois*, which had been grown at Chiswick. It is a variety of good habit, with fine double blossoms of a lively rose-pink, and will prove quite an acquisition. A similar award was made to Mr. W. Bull, Chelsea, for *Spiraea Aruncus astilboides*, a beautiful hardy Japanese plant from the alpine province of Nambu, in the north of Nippon. It grows about 2 feet high, and has ternately bipinnate-toothed leaves the terminal leaflets of which are larger, ovate-acuminate, the lateral ones smaller and rounder; the plumy white inflorescence forms a twice-branched spicate panicle, and is very showy and attractive. This new *Spiraea* may be popularly described as a dwarfed and more refined form of the grand *S. Aruncus*. Colonel Clarke received a Certificate of the same value for an interesting hybrid *Ismene*, bred between *I. Amances* and *I. calathina*, a showy bulbous plant of rather tall growth, remarkable for the prettily-fringed pale lemon-coloured cup of its showy blossoms. The plant, Colonel Clarke explained, was interesting as being an exact reproduction of the sulphur-coloured mule bred by Herbert. Two *Pelargoniums* gained First-class Certificates, a Decorative and a Silver Tricolor variety respectively. The first-named, *Eclipse*, came from Mr. W. W. Brown, Brent Nurseries, Hendon, and was a free-blooming sort, with

crimson flowers of good form, bearing a black spot on each petal, those on the upper larger, and those on the lower petals of smaller size. The second, named Mrs. G. Garraway, was a very bright-coloured sort, with a broad well-defined crimson zone, here and there splashed with dark, a mottled-green centre and a creamy edge, altogether a very pleasing and attractive novelty, and apparently a free grower, and was shown by Mr. G. Garraway, Lower Swainswick, Bath.

FRUIT COMMITTEE.—H. Webb, Esq., in the chair. At this meeting Mr. Wildsmith, Heckfield, showed a dish of President Strawberries of extra fine quality; and Mr. Ross, gr. to C. Eyre, Esq., Walford Park, Newbury, sent a splendid dish of Bourjassotte Grise Figs—the finest flavoured of all cultivated varieties. An excellent dish of Mushrooms came from Mr. Lyon, gr. to E. H. Scott, Esq., Sunbridge Court, Kent; and Mr. Miles, gr. to Lord Carington, sent a good sample of Laxton's Minimum Pea, short and almost straight in the pods, and well filled. Seedling scarlet-fleshed Melons were exhibited by Mr. Charles Howe, The Gardens, Benham Park, and Mr. J. Allsop, The Gardens, Dalton Hall, Hull—the variety from the former named Benham Park Gem, and that from the latter Allsop's Scarlet-flesh; no award was made in either case. Chilton's Hybrid Hero of Bath, a scarlet-fleshed variety, shown by Mr. J. Chilton, The Gardens, Aston Rowant, Tetworth, also failed to get an award. From Mr. R. Dean, Ealing, came a sample of a seedling Potato (between Fenn's Early Market and Porter's Excelsior), named Early Cluster, which had been grown in an 8-inch pot, and produced about 1 lb. weight of tubers. It appears to possess considerable merit for pot culture, and will no doubt be well tried for this work another season. Mr. Watson, of St. Albans, showed a black-spine Cucumber named Antagonist; and Mr. Gardiner, gr., Ettington Park, Stratford-on-Avon, showed an Apricot branch well set with fruits.

The Weather.

- June 3.—A dull, overcast day. Cold. A little rain fell after 11 P.M.
- 4.—Overcast and dull till 1 P.M.; fine and bright after. Cloudless at night. Cold. Rain fell in early morning.
- 5.—Fine till evening, then overcast and wet. Strong wind. Cold day.
- 6.—Generally dull and cloudy till evening, then fine. Frequent rain in morning. Cold and windy.
- 7.—Fine, but frequently dull, cloudy and showery. Strong wind.
- 8.—Fine, but occasionally dull with heavy showers. Cloudless after 7 P.M. Cold. Strong wind.
- 9.—A dull day, steady rain fell from 11 A.M. to 6 P.M. Fine and cloudless at night. Cold day.

LONDON: *Barometer*.—During the week ending Saturday, June 5, in the suburbs of London the reading of the barometer at the level of the sea decreased from 30.44 inches at the beginning of the week to 30.11 inches by the afternoon of May 31, increased to 30.15 inches by the morning of June 1, decreased to 29.88 inches by the afternoon of the 3d, increased to 30.02 inches by noon on the 5th, and was 30.01 inches at the end of the week. The mean reading for the week at sea level was 30.06 inches, being the same as that of the preceding week, and 0.08 inch above the average.

*Temperature*.—The highest temperatures of the air observed by day varied from 65.4° on May 30 to 54.1°

on the 31st; the mean value for the week was 60½°. The lowest temperatures of the air observed by night varied from 39° both on May 30 and June 5 to 47½° on June 3; the mean value for the week was 43°. The mean daily range of temperature in the week was 17½°, the greatest range in the day being 26½°, on May 30, and the least 9½°, both on May 31 and June 3.

The mean daily temperatures of the air and the departures from their respective averages were as follows:—May 30, 52°, - 4°; 31st, 48°·8, - 7°·5; June 1, 50°·2, - 6°·3; 2d, 52°·7, - 4°; 3d, 50°·7, - 6°·2; 4th, 49°·2, - 7°·9; 5th, 49°·1, - 8°·2. The mean temperature of the air for the week was 50°·4, being 6°·3 below the average of observations extending over a period of sixty years.

The highest readings of a thermometer with blackened bulb in vacuo, placed in the sun's rays, were 140° on May 30, and above 120° on June 1, 2, and 4; on May 31 the reading did not rise above 60°. The lowest readings of a thermometer on grass, with its bulb exposed to the sky, were 26½° on May 30, and 30½° on June 5; the mean of the seven lowest readings was 37°.

Wind.—The direction of the wind was variable, and its strength during the latter part of the week strong.

The weather during the week was generally dull, though at times fine, cold, and showery.

Rain fell on five days; the amount measured was 0.64 inch.

ENGLAND: Temperature.—During the week ending Saturday, June 5, the highest temperatures of the air observed by day were above 70° at Cambridge, Nottingham, and Sunderland, and below 64° at Bristol and Norwich; the mean value from all stations was 66½°. The lowest temperatures of the air observed by night were below 38½° at Truro, Brighton, Leicester, Cambridge, Nottingham, and Sheffield; and above 43° at Liverpool and Sunderland; the general mean from all places was 39½°. The extreme range of temperature in the week was above 33° at Truro, Cambridge, and Nottingham, and below 23° at Norwich, Birmingham, and Liverpool; the mean range of temperature from all stations was 27½°.

The mean of the seven high day temperatures was above 62° at Brighton, Cambridge, and Sunderland, and below 57½° at both Leicester and Wolverhampton; the mean from all places was 60°. The mean of the seven low night temperatures was below 44° at Bristol, London, Wolverhampton, Nottingham and Sheffield, and above 47° at Plymouth and Liverpool; the mean value from all stations was 45°. The mean daily range of temperature in the week was above 17½° at Brighton, London, and Cambridge, and below 13° at Leicester, Norwich, and Liverpool; the mean daily range of temperature from all places was 15°.

The mean temperature of the air for the week from all stations was 50½°, being 1° lower than the value for the corresponding week in 1879. The mean temperature was above 51½° at Truro, Plymouth, Cambridge, and Sunderland, and below 49½° at Bristol, Leicester, Wolverhampton, and Sheffield.

Rain.—Rain fell on every day in the week at Leicester, Hull, and Bradford, and on five or six days at most other places. The heaviest falls were at Nottingham, 1 inch. Leicester, 0.95 inch, and Wolverhampton, 0.91 inch; and the least falls were at Sunderland, 0.17 inch, and Brighton, 0.27 inch; the average fall over the country was 0.65 inch.

The weather during the week was generally dull and cold, with frequent rain.

SCOTLAND: Temperature.—During the week ending Saturday, June 5, the highest temperatures of the air observed by day varied from 72½° at Edinburgh to 63½° at Aberdeen; the mean value from all places was 69½°. The lowest temperatures of the air observed by night varied from 39° at both Aberdeen and Perth to 42° at Leith; the general mean from all stations was 40½°. The mean range of temperature in the week from all places was 29½°.

The mean temperature of the air for the week from all stations was 52½°, being 3½° higher than the value for the corresponding week in 1879. The highest was at Dundee, 53½°, and the lowest at Aberdeen, 50½°.

Rain.—The amounts of rain measured varied from 0.60 inch at Greenock, and 0.56 inch at Perth, to 0.10 inch at Aberdeen. The average fall over the country was 0.35 inch.

DUBLIN.—The highest temperature of the air was 66½°, the lowest 37½°, the extreme range 29°, the mean 52½°, and the fall of rain 0.68 inch.

Enquiries.

He that questioneth much shall learn much.—Bacon.

GARDEN WALKS.—What is the best material for making garden walks, combining cheapness and durability? A. B.

PUDDLING THE SIDES OF A POND.—I have a pond in a leaky state, and wish to gain some practical information as to the best and cheapest manner by which the sides and bottom could be rendered water-tight. Will some one who has had experience in pond work be so good as to describe the best system of puddling to adopt in such a case? Urania.

SCALE ON PLUM TREES.—Three years since I found my wall Plum Trees infested by a brown bug or scale about the size of a split pea, soft and pulpy at first, and afterwards becoming dried up. It was accompanied by an oblong diaphanous white scale, about 1/16th of an inch long—whether the same "beast" in another stage I know not, as I am not entomological. The first year I handpicked (and a dirty job it was); next year I removed trees from wall, and washed them and it with Gishurst Compound; this year I removed the trees from wall (a good brick one), filled up all nail-holes, and syringed wall and trees with a cream of hot lime. Wall and trees are still a brilliant white, yet the nasty beasts are as numerous as ever. What must I try next? Perth.

Answers to Correspondents.

AZALEAS: J. F. M. The practice you mention is followed by the Ghent nurserymen with their stock plants, but their summers are warmer than ours, and consequently the necessary stimulus and subsequent ripening off are secured. It would not succeed here except in exceptionally warm seasons. Besides, as we understand, the plants in the case alluded to are planted out—not merely stood out. They should have a gentle stimulus to excite growth and ripen up the buds, and may then be set out for a short period in a moderately sheltered place, so as to give them rest, with advantage.

BOOKS: J. F. C. Paxton's Botanical Dictionary (Bradbury & Co.). The price is 25s.

CELERY: J. C. Your Celery leaves are attacked by the maggot of the Celery Fly, which was very troublesome last year, and has already commenced its attacks this season. The only remedies are to crush the maggot by pressing it between the fingers before it becomes too abundant, or to pick off the affected leaves and burn them. Instant action is necessary. The attack has nothing to do with the seeds.

CYCLAMENS: H. C. We do not know anything about "planting out" Cyclamens in the way you refer to, and cannot recommend the practice. The best plan of culture is to sow freely every year, to grow on the plants freely without any break in their development, and to throw the exhausted ones away, or, if larger plants are required, to shift them on for the second year's bloom. The utmost care should be taken to prevent greenfly from settling upon them.

CORRIGENDUM.—M. JEAN VERSCHAFFELT.—We are pleased to be able to correct an error into which we fell when speaking of M. Nuytens Verschaefelt in our last issue. M. Jean Verschaefelt is still alive and well, though much afflicted at the loss of his adopted son. May it be long before we have occasion to speak in the past tense of M. Jean Verschaefelt.

EDELWEISS: R. T. It has appeared at some of the shows this year, but is nevertheless rare.

INDIARUBBER PLANT: R. T. With care to avoid over-watering, you might strike the Ficus elastica in a greenhouse during the hot summer months. If your plant has outgrown your convenience, why not try to induce the top to root by cutting away a ring of the bark and tying some damp moss around it, or cutting it half-through, and fixing a pot or box of earth for it to root into while still attached to the parent?

INSECTS: I. H. Jamaica. The beetles you have sent, which you found boring into your young Mahogany trees, are two of the largest species of the wood-boring genus Apatte, A. muricatus and terebrans. They are natives of Africa, as well as of the West Indies. In the larva state they are white, fat, fleshy grubs, which generally lie in a semicircular position feeding in the trunks of the trees. One of the smaller species, Apatte capricana (figured, with its history, in an early volume of the Gardeners' Chronicle), bores into the Oak, and occasionally does much injury in our dockyards. I. O. W.

NAMES OF PLANTS: W. P., Epping. Rosa Lawrenceana, fl.-pl.—D. P. 1, Centaurea montana; 2, Hesperis matronalis; 3, Claytonia alsinoides.—G. S. 1, Habenanaria chlorantha; 2, Thalictrum flavum; 3, Polystichum bipartense; 4, Cephalotaxus Fortunei; 5, Pteris Billardierei; 6, Alchemilla alpina.—H. Adams. 1, Oncidium Harrisonianum; 2, unnamable without flowers; 3, Lycaste aromatica var. retusa.—Fitz. 1, Paris quadrifolia; 2, Listera ovata; 3, Poterium sanguisorba.—T. F., Kidderminster. Alonsoa incisaefolia.—J. H. 1, Veronica chamaedrys; 2, Saxifraga granulata flore-pleno.—Cannon & Reid. Erysimum ocheolucum.—J. Lodge, Mill Hill. Polygonum bistorta.—Francis C. 2, Saxifraga Andrewsii; 3, S. Geum; 4, S. umbrosa; 5, S. cuneifolia; 10, S. hypnoides.—F. Ferguson. 1, Viburnum opulus; 2, Centaurea nigra; 3, Charophyllum sylvestre; 4, Barbarea vulgaris.—H. Roberts. Lilium pyrenaicum.—

R. L. 1, too young, perhaps the seedling state of Dicksonia squarrosa; 2, Hypolepis distans; 3, Struthiopteris germanica; 4, Pteris scaberula; 5, Hypolepis tenuifolia; 6, Polystichum capense.—J. Downie. Celsia cretica.—R. A. It is impossible to name such wretched scraps satisfactorily, besides which you send far beyond our specified limit of six subjects at one time. 1, is probably Asplenium Fabianum; 2, Asplenium bulbiferum; 4, Pteris hastata major; 7, Lastrea dilatata collina; 8, Polystichum angulare proliferum; 13, Onychium japonicum. The tips of miserably-grown fronds are the worst possible specimens to send.—H. B. 23, Lycaste aromatica; 24, Maxillaria Harrisonae; 25, Laelia purpurata; 26, Cyrtopodium barbatum. We do not recognise the Dendrobium.—R. L. 1, Tilia alba; 2, Magnolia acuminata; 3, probably some Gleditschia, but too imperfect; 4, not recognisable.

ORCHARD-HOUSE TREES: Grais's. With Peaches trained over the roof nearly to the top, the others, plunged in pots, have but a poor chance of success. Your treatment does not seem to be sufficiently discriminative. You had better get, and carefully read, Mr. Rivers' little book on Orchard Houses.

PACHYPHYTON: R. T. The leaves certainly do root, and subsequently form plants; so that we can only say "wait on." Perhaps you have not helped them on by any extra warmth or enclosure.

Markets.

COVENT GARDEN, June 10.

Grapes are selling freely at a slight reduction on last week's prices, and Strawberries have met with a serious decline, some fair samples of outdoor fruit making their appearance. Vegetables, since the recent rain, are in plentiful supply. James Webber, Wholesale Apple Market.

FRUIT.—RETAIL PRICES.

Table with 4 columns: Fruit name, s. d. s. d., and price. Includes Apples, Apricots, Cherries, Cob Nuts, Gooseberries, Lemons, Melons, Oranges, Peaches, and Strawberries.

VEGETABLES.—RETAIL PRICES.

Table with 4 columns: Vegetable name, s. d. s. d., and price. Includes Asparagus, Beans, Beet, Cabbages, Carrots, Cauliflowers, Celery, Chilis, Cucumbers, Endive, Garlic, Herbs, Horse Radish, Lettices, Mint, Mushrooms, Onions, Parsley, Peas, Potatoes, Radishes, and Turnips.

PLANTS IN POTS.—WHOLESALE PRICES.

Table with 4 columns: Plant name, s. d. s. d., and price. Includes Arum Lilies, Bedding Plants, Begonias, Bouvardias, Calceolarias, Carnations, Coriander, Eucharis, Forget-me-not, Euonymus, Ferns, Ficus, Foliage Plants, and Fuchsias.

CUT FLOWERS.—WHOLESALE PRICES.

Table with 4 columns: Flower name, s. d. s. d., and price. Includes Abutilon, Anemone, Arum Lilies, Azalea, Bouvardias, Calceolaria, Carnations, Cornflower, Eucharis, Forget-me-not, Gardenias, Heliotropes, Lily of the Valley, Mignonette, Pansies, Pelargoniums, Pinks, Polyanthus, Primula, Ranunculus, Roses, Spirea, Stephanotis, Tropaeolum, Tuberoses, and Wallflowers.

**NEW PATENT GRASS-CUTTERS**

(PATRONISED BY THE BOARD OF WORKS).

W. CLARK, 232, Oxford Street, London, W.,

Begs to call public attention to a Patent Grass-Cutter he has just invented for use in the Garden and Farm, based upon the principle of the well-known "Clark's" Horse-clipping Machine, and which is, by its lightness of construction and rapidity of action, far preferable to the existing implements in use, and supplies a want long felt by every one who possesses a garden, namely, an instrument which will mow grass where inaccessible to the lawn mower, trim grass plot edges, clip Ivy and other creepers, also shrubs and trees, and keep in order Box borders and fancy Trees, &c.; all which this ingenious little instrument is capable of doing.

It is made in three sizes, to cut in breadth 8 inches, 12 inches, and 16 inches respectively; and is so easy in working, and at the same time so effective, that even ladies can work it without feeling fatigued, there being no occasion to stoop on account of the long wooden handles attached to the machine, and a greater quantity of work can be done in a given time than by any other method.

This invention is also applicable for Farm purposes—Reaping Corn and other Crops, Clover, Rye, &c., equally as well as accomplishing the objects for which it is required in the garden; and the cost being so small in proportion to the saving in time and quality of finish effected, it is placed within the reach of all, and needs but a trial to prove its superiority.

**PRICES.**

The 8-inch Machine, complete with Rollers and Tray	.. ..	21s.
Ditto, without Rollers and Tray	.. ..	18s.
The 12-inch Machine, complete with Rollers and Tray	.. ..	28s.

SAMUELSON & CO.'S

"VILLA" AND "FAVORITE"  
PATTERNS ARE THE BEST.

London Agents: HILL & SMITH, Queen Victoria Street, T. BRADFORD AND CO., Holborn (and all respectable Ironmongers in Town or Country). MANUFACTORY: BANBURY, OXON.

"EUREKA" FUMIGATORS are the best and cheapest for all purposes. May be had from all Seedsmen, &c., 2s., 2s. 9d., 4s. 3d., 6s. 6d. each, package extra. TOBACCO CLOTH, 10d. per pound. SEED DRILLS, CAP GLASSES, SYRINGES, &c. LISTS free. SYERS, Bowdon, Cheshire.

PEA STICKS and ROSE STAKES.—Extra good, full length Pea Sticks, 2s. 6d. per 100, 50 in a bundle; 4 to 5 feet Rose Stakes, 1s. per dozen. Free on Great Western Railway. Terms cash with order. H. ELLIOTT, 51, High Street, Maidenhead.

NETTING for FRUIT TREES, SEED BEDS, RIPE STRAWBERRIES, &c. TANNED NETTING for protecting the above from Frost, Blight, Birds, &c., 2 yards wide, 3d. per yard, or 100 yards 20s.; 4 yards wide, 6d. per yard, or 50 yards 20s. NEW TANNED NETTING, suited for any of the above purposes, or as a Fence for Fowls, 2 yards wide, 6d. per yard; 4 yards wide, 1s. per yard; ½-inch mesh, 4 yards wide, 1s. 6d. per yard. TIFFANY, 5s. and 6s. per piece of 20 yards. LAWN TENNIS NETS from 16s. to 25s. EATON and DELLER, 6 & 7, Crooked Lane, London Bridge.

NETTING to PROTECT FRUIT from BIRDS.—New Nets, any size, 1½d. and 1¼d. per yard. Repairs ditto, at ¾d. and 1d. per yard. Cheap Lengths of repaired Herring Nets for Garden purposes. FINE TWINE, 20 yards by 4 yards, 1s.; 30 yards by 8 yards, 1s.; 40 yards by 12 yards, £1 10s. STRONG, 30 yards by 4 yards, 10s.; 24 yards by 8 yards, 16s.; 30 yards by 12 yards, £1 10s. NEW NETS, 30 yards by 4 yards, 15s.; 30 yards by 8 yards, £1 10s.; 30 yards by 12 yards, £2 5s. LAWN TENNIS NETS, light make, 42 feet by 5 feet, 7s.; medium, 10s.; strong, 12s. CRICKET NETS, 2-inch mesh, 6 yards by 2 yards, light make, 7s.; strong, 10s. NETTING, 1½-inch mesh, for surrounding Lawn Tennis Ground, cheap. ON SQUARE MESH, new strong, 2½d. and 3d. per square yard. Orders by Post promptly attended to. S. EDDY AND CO., 46, Holdsworth Street, Kensington, Liverpool.

**WIREWORK SUMMER HOUSES**

(with Zinc or Trellis Tops).

For GARDEN and CONSERVATORY WIREWORK see Illustrated CATALOGUE.

R. HOLLIDAY,

HORTICULTURAL IRON and WIRE WORKS, "The Pheasantry," Beaufort Street, Chelsea, London, S.W.

EDGINGTON'S GARDEN NETTING, the cheapest and most durable, at 1d. per square yard, or in quantities of 250, 500, or 1000 yards carriage free. EDGINGTON'S MARQUEES and GARDEN TENTS are the prettiest. EDGINGTON'S MARQUEES for Hire are the most handsome and capacious. EDGINGTON'S RICK-CLOTHS for seventy-two years have maintained their celebrity as the best. HAYTHORN'S and WALLER'S NETTINGS. A quantity of good Second-hand Government TENTS from Abyssinia for Sale, cheap. Sample of material free on application. Be particular—FREDK. EDGINGTON AND CO., 52 (only), Old Kent Road, London, S.E.

Gather Honey from Your Flowers. NEIGHBOUR'S Celebrated BEEHIVES. PHILADELPHIA EXHIBITION, 1876. PARIS EXHIBITION, 1877, 1878.

Three Silver Prize Medals awarded George Neighbour & Sons. The IMPROVED COTTAGE BEEHIVE, as originally introduced by G. Neighbour & Sons, working three bell-glasses, is neatly and strongly made of straw; it has three windows in the lower Hive. This Hive will be found to possess many practical advantages, and is more easy of management than any other Beehive that has been introduced.

**A. LEETE & CO.,**  
PAINT AND COLOUR MANUFACTURERS,  
129, LONDON ROAD, SOUTHWARK, S.E.

**HILL AND SMITH'S BLACK VARNISH,**  
Oil Paint No Longer Necessary.  
for Preserving Ironwork, Wood, or Stone.  
(Registered Trade Mark.)

This VARNISH is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the advertisers, and its genuine good quality, notwithstanding a host of unprincipled imitators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requires no mixing or thinning and is used cold. It is used in the grounds, at Windsor Castle, Kew Gardens, and at the seats of many hundreds of the Nobility and Gentry, from whom the most flattering testimonials have been received.

Sold in casks of about 30 gallons each, at 15 6d. per gallon at the Manufactory, or 1s. 8d. per gallon carriage paid to any Station in the Kingdom.

**UNSOLICITED TESTIMONIAL.**  
"Pierceland Park, June 21, 1875.—Sirs,—I have this day forwarded from Chepstow to your address a black varnish cask, to be filled and returned with as good Varnish as the last we had, which I candidly admit was the best we ever had. Address Varnish to Pierceland Park, Chepstow.—I am, Sirs, yours respectfully, Wm. Cox."

**CAUTION.**—HILL & SMITH would particularly warn their Customers against the various cheap Varnishes now so much advertised.

H & S's Varnish has been an article of common use on most of the large estates in the kingdom for upwards of thirty years; and their constantly increasing trade in it, and the numerous Testimonials they receive, stamp it as a truly genuine article. Every cask is legibly marked with their name and Registered Trade Mark as above, without which none is genuine.

Large Illustrated CATALOGUE of Fencing, Hurdles, Field and Entrance Gates, &c. sent free on application to HILL AND SMITH, Brierley Hill Ironworks, Staffordshire; 118, Queen Victoria Street, London, E.C.; and 180, Buchanan Street, Glasgow.

**JONES & ATTWOOD.**

**ENGINEERS and IRONFOUNDERS,**  
STOURBRIDGE.

JONES'S IMPROVED EXPANSION JOINT. THE BEST HOT-WATER JOINT.

Medal Awarded Horticultural Show, Aston, 1875.

GROVER, Builder, Wilton Works, New North Road, N., who will send a Photo.

**X PIPES.—PIPES.—PIPES. X**  
The Cheapest House in the Trade for HOT-WATER PIPES and CONNECTIONS. 4-inch Pipes, 1s 11d. per yard. Other sizes equally low. F. AND J. SILVESTER, Castle Hill Foundry, Engineering and Boiler Works, Newcastle, Staffordshire.

**JONES'S PATENT "DOUBLE L" SADDLE BOILER.**

These Boilers possess all the advantages of the old Saddle Boiler, with the following improvements—viz., the water-space at back and over top of saddle increase the heating surface to such an extent that a "PATENT DOUBLE L SADDLE BOILER" will do about twice the amount of work with the same quantity of fuel; the cost of setting is also considerably reduced, and likewise the space occupied; at the same time these Boilers are simple in construction, and being made of wrought-iron are not liable to crack. They are made of the following sizes:—

Sizes.			To heat of 4-in. Pipe.	Price.
High.	Wide.	Long.	Feet.	£ s. d.
20 in.	18 in.	18 in.	300	7 0 0
20 "	18 "	24 "	400	8 0 0
20 "	18 "	30 "	500	9 0 0
24 "	24 "	24 "	700	12 0 0
24 "	24 "	30 "	850	14 0 0
24 "	24 "	36 "	1000	16 0 0
24 "	24 "	48 "	1400	20 0 0
28 "	28 "	60 "	1800	25 0 0

Larger sizes if required.

From Mr. CHARLES YOUNG, Nurseries, Balham Hill, S.W., May 29, 1873.

"Having given your Patent 'Double L' Boilers a fair trial at my Nurseries, I beg to say that they are most satisfactory. I consider them the best in use, and without doubt the most economical of all boilers; they will burn the refuse of other tubular boilers I have in work."

PRICE LISTS of HOT-WATER PIPES and CONNECTIONS, with Boilers, of all sizes and shapes; or ESTIMATES for HOT-WATER APPARATUS, erected complete, will be sent on application.

J. JONES AND SONS, Iron Merchants, 6, Bankside, Southwark, London, S.E. When ordering Boilers please refer to the above advertisement.

**By Royal Letters Patent.**

**RITCHIE'S GAS LIGHTING and HEATING APPARATUS.**

3 feet 6 inches, 5 feet, and 6 feet.

No Flue required. Specially adapted for Drying Newly-built Houses. Silver Medal awarded in 1878 at Wolverhampton Exhibition. The celebrated and unpleasant vapours arising from the burning of ordinary coal gas are prevented from escaping, and are made to circulate within the Apparatus or Stove in such a way that they become thoroughly condensed, and are carried off in the form of a liquid, in which will be found the sulphur and other poisons which are drawn from air and would in the ordinary way be left in and mixed with the surrounding atmosphere; consequently health is not prejudicially affected, Works of Art, Plants, Pictures, Books, Furniture, &c. are not injured, and the atmosphere is rendered uncontaminated and perfectly healthy.

Prices from 50s. to £10 10s.

Full particulars and testimonials forwarded on application to RITCHIE AND CO., 23, St. Swithin's Lane, London, E.C.

**Under the Patronage of the Queen.**

**J. SMITH'S IMPERISHABLE STRATFORD LABELS.**

PAINTER, GLAZIER, WRITER, &c.—Married; has had thirty-one years' good experience with Plants and Furnishing.—W. TERRY, 52, Hendon Street, Kemp Town, Brighton.

EPPS'S COCOA.

GRATEFUL AND COMFORTING.

JAMES EPPS AND CO., HOMOEOPATHIC CHEMISTS.

HOLLOWAY'S PILLS and OINTMENT.—Dyspepsia, Jaundice.—These complaints are the results of a disordered liver, which secretes bile in quality or quantity incapable of digesting food. Digestion requires a free flow of healthy bile, to insure which Holloway's Pills and Ointment have long been famous, far eclipsing every other medicine. Unsuitable food, irregularity of living, unhealthy climates, and other causes are constantly throwing the liver into disorder, but that important organ can, under all circumstances, soon be regulated and healthily adjusted by Holloway's Pills and Ointment, which are directed upon its vital secretion. The Ointment rubbed on the skin penetrates immediately to the liver, whose blood and nerves it rectifies. One trial is all that is needed; a cure will soon follow.

WHAT PRODUCES HAIR?

"We are glad to be able to announce that an answer has been found to this long puzzling and perplexing of questions in Warde's Capillary, which, however, turns out not to be a 'new discovery,' but one that has been in use in the practice of a physician of eminence for many years . . . and so successfully as to produce many beautiful growths of hair, as also whiskers and moustaches in abundance. . . . The secret of its preparation has been purchased by Messrs. Warde & Co., and these gentlemen are giving to society at large what, until lately, has been confined to a limited circle—A REAL HAIR PRODUCER."—Civil Service Gazette.

A beautiful Head of Hair, Whiskers, Moustaches and Eyebrows positively produced by the use of WARDE'S CAPILLARE (The only "Comme il faut" Hair Producer).

(After a course of Warde's Capillary).

It preserves the natural colour of the hair; keeps it from thinning; is a SPECIFIC for PREMATURE BALDNESS; and thoroughly eradicates scruff and dandruff. Its fragrance and purity, moreover, recommend it FOR DAILY USE, as the best dressing for the Capillary.

Not genuine without Warde & Co.'s signature on the label, thus *Warde & Co.* Beware of those who copy the style of our Advertisements, and then "Caution" you that theirs have been so treated. Directions for use with each bottle.

Price, 2s. 6d. per bottle, three bottles 6s. 6d., Privately packed, carriage paid.

Can be obtained from all Chemists, per order on Wholesale Houses; or sent under cover, upon receipt of remittance, by G. WARDE & CO., 16, Gt. MARLBRO' ST., LONDON, W.

"Facts Speak Louder than Words."

The Chemist and Druggist says:—"Mr. Saville has sent for our inspection a large bundle of testimonials he has received from persons who have obtained the desired results, after using his preparation. We confess that, testimonial-hardened as we are, we could not help feeling convinced, from THEIR EVIDENTLY GENUINE CHARACTER, that Saville's Capillary Germinator has really a decided effect when the hair is falling or fallen off."

GUARANTEED to effect this marvellous change in a few weeks.

BEFORE USE. NEVER FAILS. AFTER USE.

The following is a fair specimen of the letters we are daily receiving, which prove the good qualities of

"SAVILLE'S CAPILLARY GERMINATOR" As a Real Producer of

WHISKERS, MOUSTACHES, EYEBROWS, &c., And as a Complete and Certain Cure for BALDNESS,

Or for Weak, Thin, and Falling Hair.

New Chester Road, Tranmere, Cheshire, April 30, 1880. "Dear Sir,—Will you kindly forward me another bottle of your 'Capillary Germinator,' as I have found it to be beneficial and quite capable of producing what I so earnestly desired. I shall recommend this wonderful producer to all my friends and comrades. I shall be in London soon, and shall have the pleasure of showing you my capital Whiskers and Moustaches, which your preparation has to my satisfaction produced.—I remain, yours respectfully, W. C. MAGER."

Harmless, free from grease, nicely scented, will not stain nor injure the skin. The original of the above, with hundreds of similar letters, may be seen at any time.

Full particulars with forty testimonials sent free to any address.

Of all Chemists, Perfumers, &c. Sent, carriage paid, to any address, secretly packed, with testimonials, directions for use, &c., for 2s. 6d. Larger sizes, FREE, 5s., 9s., and 12s.

JOHN F. SAVILLE AND SONS, 146, Regent's Park Road, London, N.W.

Beware! Beware!!—Every genuine bottle has above title impressed in the glass. Do not be deceived into buying any imitations of this thoroughly reliable article.

# "THE COVENTRY" LAWN MOWER

(REGISTERED). MANUFACTURED BY

## NETTLEFOLD & SONS,

54, HIGH HOLBORN, LONDON, W.C.

The attention of the Public is invited to "THE COVENTRY" LAWN MOWER, which can be confidently recommended as the best and cheapest in the market; for lightness and ease in working it cannot be surpassed. It has all the improvements which have of late been introduced into this class of Machine, either in England or America. It will cut wet or dry grass of any length, will turn in its own width, and is so light that a lady can use a 15-inch Machine of this make with greater ease than a 10-inch of the ordinary kind. It is cheaper than any other Machine of its class before the public. It is made, as its name implies, at Coventry, by skilled English workmen, and of best English Steel and Iron. These Machines can also be supplied with rollers at same price, and with Grass Boxes at a small extra cost.

LA BELLE SAUVAGE YARD, LUDGATE HILL, LONDON, E.C.; 21, BACHELORS' WALK, DUBLIN.

TWO GOLD MEDALS  
Awarded to us by  
Royal Horticultural Society,

At the Grand Show at Preston,  
July, 1878,  
Out of Fourteen Competitors.

Having extensive works, special machinery, and first-class workmen, who have been many years in the trade, we are able to supply the very best class of buildings at an extremely low price. As we are the only firm in the kingdom that has ever been awarded Two Gold Medals by the Royal Horticultural Society, this will be some proof of the quality of our productions. Our buildings are constructed so as to combine great strength, simplicity, and durability, with extreme lightness, and being made of the very best materials, will, with ordinary care, last

a lifetime. The ventilators at top and bottom open the whole length with one handle to each series. The glass used is 21-oz. British sheet, and the paint the best genuine white lead and oil. HEATING APPARATUS, with thoroughly reliable *Bowers* supplied and fixed in the most practical and efficient manner, and guaranteed to work economically and answer its purpose in all seasons. We devote special personal attention to this branch of our business, and have never had a failure.

Plans, Estimates, and Catalogues free. Customers waited on in any part of the Kingdom.

R. HALLIDAY & CO., Royal Horticultural Works, MIDDLETON, MANCHESTER.

# RANSOMES' NEW "GLOBE" LAWN MOWER.

A FIRST-CLASS ANGLO-AMERICAN MACHINE.

Ransomes, Sims & Head's "Globe" Mower possesses all the American improvements, with the special advantages of the more accurate fitting and general durability of English manufacture, and perfect adjustment. It will cut wet, dry, long or short grass, without clogging, and take off almost all the "bents." Made in four sizes, from 8 to 16 inches wide. Price from 42s., carriage paid, and a month's trial allowed.

ILLUSTRATED PRICE LISTS FREE BY POST.

RANSOMES, SIMS & HEAD, IPSWICH, and ALL IRONMONGERS.

SALES BY AUCTION.

Brentwood.

To FLORISTS and OTHERS.

MESSRS. PROTHEROE AND MORRIS will sell by AUCTION, at the "White Hart" Hotel, Brentwood, on THURSDAY Evening next, June 24, at half-past 6 o'clock precisely, the Detached FREEHOLD RESIDENCE and SHOP, with the Garden and several Green-houses in the rear, now in the occupation of Mr. Mann; also the GOODWILL of the old-established Business of a Nurseryman and Florist, which has been carried on upon the Premises for many years past. Possession will be given on completion of the purchase. Stock optional.

Particulars and Plans may be had at the Auctioneers' Offices, 98, Gracechurch Street, E.C., and Leytonstone, E.

Cattleya Mosses.

MR. J. C. STEVENS has received instructions from Mr. F. Sander, St. Albans, to SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY, June 24, at half-past 12 o'clock precisely, a grand importation of CATTLEYA MOSSIE, in splendid masses, and in finest possible condition, well furnished with green leaves, breaks, and plump eyes. Owing to its ever-varying character, its easy culture, and fine habit, this splendid Cattleya is undoubtedly one of the very best.

May be viewed the morning of Sale, and Catalogues had.

Importation from Borneo, Received Direct.

MR. J. C. STEVENS will sell by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, on THURSDAY, June 24, at half-past 12 o'clock precisely, SACCOLABIUM HARRISONI, fine semi-established plants; AERIDES AFFINE ROSEUM, VANDA LAMELLATA, about 500 plants of CYPRIPEDIUM NIVEUM, a new ANACETOCHILUS, with green leaf; 6 cases of PHALENOPSIS GRANDIFLORA, about 1000 plants; also about 200 lots of ESTABLISHED ORCHIDS, &c.

May be viewed the morning of Sale, and Catalogues had.

The "Moat," Eltham, Kent.

MR. J. C. STEVENS has received instructions from the Executors of the late -- Mills, Esq., to SELL by AUCTION, on the Premises, as above, on SATURDAY, June 26, at half-past 12 o'clock precisely, a small Collection of ESTABLISHED ORCHIDS, including most of the known varieties, a very fine specimen of ANTHURUM SCHERZERIANUM, STOVE and GREENHOUSE PLANTS, FERNS, &c.

May be viewed the day prior and morning of Sale. Catalogues had on the Premises, and of the Auctioneer, 38, King Street, Covent Garden, London, W.C.

City of Ely, Cambridgeshire.

MESSRS. BIDWELL will sell by AUCTION, at the Reading Room, Ely, on WEDNESDAY, June 23, at 2 o'clock punctually, in 22 or more lots, by direction of the Executors of the late Mrs. Sherard, VALUABLE FREEHOLD and COPYHOLD ESTATES, situate in the parishes of Ely Trinity and Ely St. Mary, containing in all 151 a. or 23 p. of Accommodation, Pasture and Arable Land, close to the City, and the exceedingly valuable property known as "The Vineyards," in the occupation of Mr. T. Pashler, comprising 14 a 11 21 p. of most fertile and productive Garden Ground, in a high state of cultivation, planted with a choice selection of Apples, Pears, Plum and other Trees in full profit and bearing; a large portion of the ground is also well planted with Gooseberry and Currant Bushes, also about 3 acres of Asparagus Beds. Along the West and North boundaries are high Garden Walls for a distance of about 950 feet, facing East and South, well covered with Wall Fruit Trees, and a substantially built Residence, with Lawn and Pleasure Garden, which stands very pleasantly and commands "The Vineyards," with necessary Offices, Fruit House and Stable.

Particulars, with Plans and Conditions of Sale, may be had at the "Lion" Hotel, Cambridge; the "George" Hotel, Huntingdon; "Great Northern" Hotel, Peterborough; the "Estate Exchange," Tokenhouse Yard, London, E.C.; of E. C. SHERARD, Esq., Solicitor, Oundle, Northamptonshire; and of Messrs. BIDWELL, Land Agents and Surveyors, Ely, and 12, Mill Lane, Cambridge.

## NEW ENGLISH ROSES for 1880.

### WM. PAUL & SON

(SUCCESSORS TO THE LATE A. PAUL AND SON—ESTABLISHED 1806),

#### PAUL'S NURSERIES, WALTHAM CROSS, HERTS,

BEG TO OFFER

The following NEW ROSES, strong plants, 7s. 6d. and 10s. 6d. each :—

**MASTERPIECE (H.P.)**—Magnificent bright rosy-crimson blooms ; large, full, and of perfect globular shape. A seedling from "Beauty of Waltham." Growth vigorous, habit good, and foliage fine.

"Probably the finest Rose of the year."—*Gardeners' Magazine*.  
"A very full rosy-pink flower, of excellent form."—*Gardeners' Chronicle*.

**CROWN PRINCE (H.P.)**—Flowers bright purple, centres shaded with lurid crimson, very large and double, petals fine ; excellent growth and habit. A most effective garden Rose, yielding large quantities of fine flowers, either for decoration or cutting, of a colour very scarce amongst Roses of its quality.

"Crown Prince, also raised at Waltham, claims special attention."—*Gardeners' Magazine*.

**LITTLE GEM (Moss)**—A miniature Moss Rose, which may be described as a crimson Mossy de Meaux. It forms compact bushes densely covered with small, double, crimson flowers, beautifully mossed. It is of charming effect in the garden, and most valuable for bouquets or vases.

"A charming little Moss Rose."—*Gardeners' Chronicle*.  
"Will make its way as a garden Rose, and be in request for cutting."—*Journal of Horticulture*.

**THE NEW FRENCH ROSES OF 1880**, 30s. per dozen.

**THE NEW ROSES OF 1879** (including Duchess of Bedford and Countess of Rosebery), 21s. to 36s. per dozen.

Good plants of the older Roses, in pots, for present planting and for greenhouse culture, 9s. to 18s. per dozen ; £3 15s. to £7 per 100.

The same, of extra size, 24s. per dozen and upwards.

*Priced Descriptive CATALOGUES post-free on application.*

Visitors by Railway can enter the Nurseries from the platform, Waltham Station, Great Eastern Railway, half an hour's ride from London.

## SELECT INDEX OF PLANTS

The Publisher of the *Gardeners' Chronicle* recommends Subscribers who wish to have extra Copies of the Numbers containing the

### SELECT INDEX of PLANTS from 1841 to THE END of 1878,

TO SECURE THEM AT ONCE.

**A. M. C. JONGKINDT CONINCK,**  
TOTTENHAM NURSERIES,  
Dedemsvaart, near Zwolle, Netherlands.

**IMPORTANT NOTICE.**  
J. CHAMBERS,  
Westlake Nursery, Isleworth, W.  
Is now prepared to send out his two new Hybrid Bulbous BEGONIAS, ROYAL STANDARD and AVALANCHE, in nice healthy little plants at 15s. each. They received First-class Certificates, June, 1879, both at South Kensington and Richmond. These are undoubtedly the two grandest Hybrid Begonias ever offered : see *Gardeners' Chronicle*, June 28, 1879. Both varieties can be seen in flower at the nursery.  
Also a new White LOBELIA MAGNIFICA ALBA. The habit is identical with that well-known variety magnifica. As a pot plant for general decoration with Lycopodium, Maidenhair, and other small Ferns, I know of nothing to equal it. Nice plants at 1s. 6d. each, or 12s. per dozen.  
Usual allowance to the Trade. Terms cash. Post-office Orders payable at Spring Grove, Isleworth, W.

**CAULIFLOWER AND CABBAGE PLANTS.**  
Our own selected stocks, in good strong plants. Veitch's Autumn Giant Cauliflower, per 1000, 7s. 6d. ; Walcheren and Early London Cauliflower, per 1000, 6s. ; Brussels Sprouts, per 1000, 5s. ; Daniel's Defiance Cabbage, per 100, 15s., per 1000, 7s. 6d. ; Enfield Market, Early Nonpareil, and other sorts, per 1000, 5s. ; Champion Drumhead or Cattle Cabbage, extra fine stock, per 1000, 4s. 6d.  
Free on Rail at prices quoted. Orders of 20s. and upwards carriage free.  
DANIELS BROTHERS,  
The Royal Norfolk Seed Establishment, Norwich.

**VIOLAS**, 20,000 fine strong plants :—  
 " cornuta, white } 5s. per 100, 45s. per 1000.  
 " Queen of Blues, }

# COTTAGER'S CALENDAR

OF

## GARDEN OPERATIONS.

ORIGINALLY COMPILED BY THE LATE SIR JOSEPH PAXTON, M.P.

Price 3d., Post Free 3½d.

W. RICHARDS, 41, WELLINGTON STREET, STRAND, LONDON, W.C.

# THE GENERAL HORTICULTURAL COMPANY

(JOHN WILLS), LIMITED,

Is now sending out the following New Plants:—

## DRACÆNA CAUSTONI (terminalis × Regina).

A fine habited, stocky-growing variety, with spreading leaves of a bronze colour, the older ones being edged with deep rose—the younger ones are entirely coloured with rosy-pink suffused with orange. It is of a remarkably robust constitution, and well adapted to be grown in small pots for decorative purposes.

*Price, 31s. 6d. each.*

## DRACÆNA WILSONI (Mooreana × terminalis).

A bold, free-growing variety, of erect growth, with leaves 24 to 30 inches long, and 5 to 6 inches broad, of a copper colour—the older ones are edged and suffused with carmine, the footstalks are long and of the same colour, giving the plant an entirely distinct character to any of the other varieties; the younger leaves are beautifully marked with rosy-pink, some are entirely of that colour, changing with age to carmine. The plant is remarkably quick growing, and well adapted for exhibition purposes.

*Price, 21s. each.*

## DRACÆNA KNAUSII (Cooperii × Regina).

A variety of very free robust growth and bold habit; the leaves are from 16 to 18 inches long, and 5 inches broad, drooping, their ground colour green, with a very distinct and even edging of pink, deepening into a bright magenta, the leafstalks being edged with deep pink. Quite distinct in character, from the elongate outline and remarkably drooping character of the foliage.

*Price, 31s. 6d. each.*

## DRACÆNA THOMSONI (terminalis × Regina).

A fine habited variety, with broad, oblong, shortly acuminate, deep green leaves, having a border about an inch wide of pale magenta-rose, the colouring being creamy with a flush of magenta in the well developed central younger portions, and deepening with age to the magenta tint above described. It is a variety of great merit, both on account of its stocky dense habit and its broad marginal variegation.

*Price, 31s. 6d. each.*

## DRACÆNA VENUSTA (Weismanii × Regina).

A very elegant and distinct variety of medium growth; the leaves are of a dark bottle-green, the older ones edged with a line of rosy-purple, the younger ones having a similar line of bright rosy-purple, within which runs a somewhat broader line of creamy-white; the leaves are very elegantly drooping, supported on short stalks, which have a deep pink margin. The plant is of a robust constitution, colouring very early, and of a very compact recurved habit.

*Price, 31s. 6d. each.*

## DRACÆNA AURANTIACA (concinna × Regina).

A very fine and effective variety of the narrow-leaved series, the habit of the plant being erect and slender, the leaves long, narrow, erect at the base, and thence arching gracefully. The leafstalks are erect, and edged with rose colour. The leaves themselves are green, broadly edged with a band, one quarter of an inch wide, of a bright orange or flame colour, pallid in the young central growth, and flushed with a salmony hue, thence deepening as it gains age into an intense flame or orange tint. The young free growth is more or less wholly suffused with this orange tint. A most telling novelty, remarkably free in growth.

*Price, 21s. each.*

## NEPENTHES SUPERBA.

A very distinct and handsome Pitcher-plant, of hybrid origin. In its general habit it resembles *N. Hookerii*, but the pitchers are intermediate between that variety and *N. Sedeni*. They are densely spotted with fiery red, which colour predominates over the entire surface; the edges of the leaves are slightly serrated, and the midrib is very conspicuous, being of a bright red colour. The plant is quick growing, producing its pitchers very freely all the year round.

*Price, 63s. each.*

## PHILODENDRON WALLISII.

A very handsome hothouse plant, with large, cordate, deep green leaves, the younger ones are of a pale yellow green, spotted with deep green. The habit of the plant is compact, and the leaves are densely set together. It is a very ornamental plant, well adapted for general or exhibition purposes.

*Price, 63s. each.*

## ADIANTUM BAUSEI (Moore).

This novelty is the produce of a cross between the well-known Maidenheads, trapeziforme and decorum, and its free vigorous growth and hardy greenhouse character show that, as far as constitution is concerned, it has taken after the latter parent, though in size it is intermediate between the two, and in its general aspect it is quite distinct from either. Its most obvious peculiarity is the drooping position of the pinnules, which are all deflexed sideways from the plane of the rachis, and this gives a perfectly unique aspect to the plant. In the form of its pinnules it also differs from any other known Fern, and this, combined with the arching character of the branches of the fronds, and the drooping habit of the pinnæ themselves, offer other distinctive features. The whole aspect of the plant is decidedly ornamental, and as it is quite unlike any other varieties, and is at the same time of a naturally free and robust constitution, it must become a valuable decorative plant, and a favourite for general cultivation.

*Price, 15s. each. Extra-sized Plants, 42s. to 63s. each.*

EASTWELL PARK.

TWO adjoining parishes lie east and west of some springs of water, or, as the Saxons called them, "wells"—one of these is now called Eastwell, the other Westwell. Eastwell Park lies on the left side of the valley of the Stour between Ashford and Canterbury, and by running down the slopes into the river valley it has embraced within its limits some fertile land for Oak, as well as some Beeches on the higher ground. An old author said of the wooded hills above Eastwell that they are much addicted to chalk! The chalk of the Down is reported by geologists 1000 feet in depth.

In the valley we have mentioned there are three parks side by side—Chilham, Godmersham, and Eastwell, the last named being a park of 1600 acres, and by far the noblest in the county of Kent. A writer on deer parks mentions this one among several others. Tatton, he says, belonging to Lord Egerton, is the largest deer park in England; Eridge, the property of Lord Abergavenny, is the oldest; and the Earl of Winchelsea's at Eastwell, the most varied in surface and in scenery. By the addition of timber to any of the slopes and jutting promontories of the South or North Downs, you may have a park of smooth turf and noble outline, such as Arundel, Goodwood, Eastwell, and others in the same formation. The loftiest landmark in Eastwell Park is an octagonal knoll, flat at top, and covered thick with trees, through which eight avenues, named the Star Walks, radiate from the centre to the outside and open a wide view, or series of views, including the course of the Medway to Sheerness, the Nore light-ship, and the coast of Kent from the North Foreland to Romney Marsh, with, on clear days, the shores of France in the distance.

Eastwell has always been a famous park for deer, and the fattest bucks in Kent were those which used to be selected here and carefully fed in small lots, in paddocks set apart for the purpose. About sixty deer were annually caught for the purpose of fattening, and Lord Winchelsea has himself described the process in these words:—"To catch deer artistically two dogs are required, one to each side. When the keeper has pointed out the deer he wishes to be taken up, a horseman rides into the herd in order to separate him from the others. This operation requires a horse well in hand and well on his haunches, so as to turn quickly as the deer turns. The dogs must also be well trained and under perfect command; they are loose and follow the keeper's horse. As soon as the deer is singled out he lays them on by giving the signal—"Hold him up." This may be done with steady dogs, even if a few does should break away with the buck, as the dogs will take no notice of them, but stick to the male deer."

The hunted bucks of Eastwell were generally brought to bay within a mile. They were "pinioned" by the Earl's trained dogs, that is,

fastened and held by the ear, and the ear only, till the arrival of the first horse-man, who, on dismounting, caught hold of the buck's hind legs below the houghs and flung him on his side or back, in which position he is easily held down even by one man.

There was no park here previous to the year 1550. In that year, at the age of eighty-one, in a small cottage, subsequently enclosed by the park fence, died Richard Plantagenet, luckless son of Richard III. The hut was a house of his own building, erected by permission of the proprietor of Eastwell Place, on his seeking refuge here after the battle of Bosworth. It stood in a field near the mansion, and here its builder died, and against the entry of his burial in the parish register is the letter "V." which denoted that the deceased was a person of noble birth. The entry is "V. Richard Plantagenet, Desembur 22d, 1555." The hut was pulled down by Heneage, Earl of Winchelsea, who died 1689.

The ancient family of Finch obtained Eastwell by marriage with the heiress of Sir Thomas Moyle, who granted Richard Plantagenet ground and materials for his hut. Sir Moyle Finch of this family was one of the first of the then new order of baronets, who died in 1614, after forming the park and enlarging the house. His widow was created Viscountess Maidstone, in her own right, by James I., and Countess of Winchelsea, by Charles I., and she must be regarded as the founder of the house of Winchelsea. Her son succeeded, and after breaks and jolts through failure of heirs male, and much tossings of the fortunes of the house, almost to the point of foundering sometimes, the titles of the Earls of Winchelsea and Nottingham still survive. Eastwell Park is now the residence of the Duke of Edinburgh; and a description of the gardens, with figures, appeared in a former volume.

## New Garden Plants.

### *FATEMANNIA WALLISII*, *Rehb. f.*

Two magnificent flowers of this, coming very near the great sketch prepared by Señor Koezl, are at hand. The lateral sepals are nearly one decimeter in length, and are rather broad. They are light greenish-yellow outside, olive-green to horse-chestnut brown inside, with some yellow at the base surrounding a few large brown areas; the petals have scarlet stripes at the very base, but, excepting this, they are coloured like the sepals. Bristles of callus greenish. Lip blade greenish with a brownish hue at the anterior part. Column white, the keel on its back, top, and the wings, and the base of the part under the fovea, are of a fresh and light green.

Whether or not the plant is a species in our sense I am a little doubtful. I called it formerly *B. Burtii* var. *Wallisii*. My actual reason for considering it now as a separate species is simply the total absence of any warts on the interior of the sepals and petals, and the curious tendency to lengthen the sepals. Then this species reaches an enormous length. The rhizome runs upwards to the height of 40 feet, according to my friend F. C. Lehmann's observations, who likewise declares it very distinct.

I had never seen good fresh flowers; so that I feel the more grateful to Messrs. Veitch for a double supply of excellent materials. *H. G. Rehb. f.*

### *CATLEYA MARDELLII*, *Rehb. f.*

A glorious two-flowered inflorescence at hand shows the indications of a third flower, so that this proves an extraordinary beauty. It was sent me by Messrs. Veitch. *H. G. Rehb. f.*

### *BULBOPHYLLUM INERS*, *n. sp.\**

This is a gracious little thing, having a brownish bulb, from  $\frac{1}{2}$ — $\frac{3}{4}$  inch high, one-leaved. Leaf cuneate, ligulate, blunt, acute, green above, purple beneath, very thick, up to 3 inches long,  $\frac{3}{4}$  wide. A slender red peduncle bears a nodding umbel of small white flowers, which have very unequal sepals, the lateral ones extending, and thus resembling the *Cirrhopedalums*. It stands near *B. radiatum* and *psychoon*.

\* *Bulbophyllum iners*, *n. sp.*—Aff. *B. radiatum*, oligoglossum et psychoon; pseudobulbis pyriformibus; foliis cuneato ligulatis acutiusculis crassis, superne viridibus, inferne purpureis; pedunculo gracili apice nutante, subumbellifero corymboso; bracteis linearibus acutis; ovaria pedicellata subaequantibus; sepalis trinerviis, lateralibus ligulatis attenuatis acutis extensis quin sepalum impar triangulum longioribus; tepalis triangularibus bene brevioribus; labello cordato triangulo; columna apice tridentato. *H. G. Rehb. f.*

and oligoglossum. There can be little doubt of its being of Assamese origin. I have to thank for it Mr. Bull, who has usually mercy on such tiny little creatures, allowing them light and room for flowering. It is no commercial plant of course. *H. G. Rehb. f.*

## MR. HARDY'S ORCHIDS.

THERE are certain localities in the kingdom that become famed for particular descriptions of plants which are there cultivated more extensively than elsewhere. In this way Manchester has earned a repu-

such representatives of the respective genera as produce flowers possessing a combination of colour and form that would commend them to any real lover of flowers generally, be they Orchids or others.

If this latter course had been followed, many who form collections would not so often find themselves in possession of plants which, when they cease to be new, have nothing to render them worthy of notice. Forty years ago, when the known species of Orchids stood in the proportion of not more than one to a score of what they are at the present day, there was some semblance of reason in buying a plant simply on

FIG. 133.—*CYPRIPEDIUM SELLIGERUM*. (SEE P. 750.)

tation or the numerous and valuable collections of Orchids that from time to time by so many individuals have been formed in the neighbourhood. Many suppose that bringing together a comprehensive assemblage of Orchids is simply a question of money, but although they cost more than most plants, still to possess a really good collection, or, what is much more preferable, a selection of the most meritorious, requires time and judgment. Nothing is more common with people when first they take a liking to these fascinating plants, than to buy everything that is new, rare, and dear, without ever taking a common-sense view of the matter, which would suggest the desirability of confining the selection to

account of its being a new species, but it is not so now. Not by any means that singularity of form or habit should be set down for nothing—the elegant drooping racemes of *Dendrochilum filiforme* will always make the plant deserving of a place in even the most select company in spite of its unattractive greenish-yellow colour. The same holds good of a few other kinds, but those poor washy *Dendrobiums*, *Cypripediums*, *Epidendrum*s, and *Odontoglossum*s bearing flowers that are a combination of dirty white, yellow, and rusty brown, are simply so much objectionable company amongst the many grand species with which they are associated.

Mr. Hardy, of Timporley, appears to have steered

clear of the above mistake, for the collection, although its formation was only commenced about four years ago, contains a large number of most of the best species in cultivation, with very few of the worthless varieties. This was fully evident at the last Manchester Whitsuntide exhibition, where Mr. Hardy took the 1st prize easily in the principal class for fifteen plants—a more than ordinary performance when it is taken into account that he was competing in a locality where there exists such a wealth of Orchids in the possession of those who are practised hands at both growing and exhibiting.

exhibited the variation which this handsome group of Orchids affords—two examples especially, *M. Veitchii* and *M. Harryana*, were in grand condition, bearing some forty flowers each. There were also one or two new kinds, not in flower, described as bearing immense blooms.

*Odontoglossums* are represented by numbers of plants of all the best species, many of which were in flower. *O. vexillarium*, *O. citrosium*, with eleven large spikes; *O. Cervantesi*, one large example of which, half a yard across, was a complete carpet of flowers: of this beautiful free-flowering genus

*C. Trianæ*, and others; all the best *Lælias*, a couple of very fine specimens of *Anguloa Clowesii*, and *A. uniflora*.

In *Dendrobiums* was the handsome *D. thyrsiflorum*, bearing sixteen fine racemes of bloom; *D. devonianum* and *D. crassinode*, *D. suavissimum*, *D. infundibulum*, *D. cucullatum giganteum*, *D. Falconeri*, *D. lituiflorum*, *D. Ainsworthii*, both varieties; *Angraecum Ellisii*, *A. sesquipedale*, *Grammatophyllum Ellisii*, *Vanda Denisoniana*, *V. cærulescens*, *V. lamellata*. These are a few out of the many fine plants in the Timperley collection, where, in addition to those already named in flower, there was also blooming *Acrides Warneri*, *A. Fieldingi*, *A. virens*, *A. crispum*, *Cypripedium Stonei*, *C. caudatum*, *C. levigatum*, *C. Lowii*, *C. niveum*; *Vanda insignis*; *Cattleya Warneri*, *C. citrina*, *C. Mendelli*; *Lælia cinnabarina*, *L. grandis*; *Dendrobium crepidatum*, *D. Findleyanum*; *Lycaste Skinneri*, several fine varieties; *Cypripedium villosum*, *C. barbatum*; *Restrepia antennifera*, *Odontoglossum phalenopsis*, *O. gloriosum*, *O. citrosium roseum*; *Oncidium Reichenbachii*, and *O. Marshallianum*.

A word about the houses in which the plants are grown: they are span-roofed, wider than generally employed in Orchid culture, substantial, the stages iron and slate covered with spar, and resting on this, but elevated above the surface, trelliswork, on which the plants are stood. The plants collectively are in rude health, the *Cattleyas* and kindred species exhibiting the peculiar bronzy tinge at the edge of the leaves indicative of abundant light and enough air, with an absence of the coddling which produces soft, flabby, overgrown leaves that do not last. The construction of the houses is such as to afford all the light possible, in addition to their standing away from anything that can lessen the amount of light; the shading is movable, fixed on rollers in the ordinary way; the material used is no thicker than requisite to break the force of the sun. Mr. Hill, the gardener here, is not, I believe, a very old hand at Orchid growing, but he has every reason to be satisfied with the plants under his charge. There are a good many houses devoted to the cultivation of other plants and to fruit—Grapes in particular, which are very promising. All the houses are unusually well built, and the general keeping of the place is a model of neatness and order. *T. Baines*.

#### DAFFODIL AND AFFODIL.

THE Daffodils of the garden, of which so much has been, and remains to be written, are not Daffodils, but Narcissi. Daffodils proper are *Asphodels*, and *Asphodels* are [in a broad sense] *Libes*. The Daffodils of the garden are *Amaryllids*, and between these and *Lily-worts* there is a world of difference. The etymology of Daffodil has become complicated through the mixing in the mind of two tribes of plants, and the result is that both the *Asphodel* and the *Narcissus* have been called Daffodils. The flower of Ovid (*Met.* iii.) was wholly or partly yellow. The *Narcissus poeticus*, now regarded as the flower of remembrance, has a purple or sanguineous girdle, encompassing a yellowish or orange cup. In other sections of the *Narciss* family yellow is the predominant colour. The history of the word Daffodil suggests that by modern usage it is altogether misapplied, and we are perhaps not wholly without means of determining when the transference or expansion took place. The Greek ἀσφodelos refers doubtless to such a flower as we should call *Asphodel*, and not to any kind of *Narcissus*. It is by no means certain that ῥάρκισσος refers to a *Narcissus*, for it may as well mean *Poison-ivy* or *head-ache-provoking Cistus*. Richardson derives Daffodil from *F. asphodille* and *des asphodilles*, Cotgrave from *Asphodill*, and Skeat (*Etymological Dictionary*, 1879) from *F. fleur d'affodille*. The last-named author recognises two difficulties in the initial *d* and the subsequent *r*. In respect of the first he suggests that it is "prefixed much in the same way as the *t* in *Ted* for *Edward* . . . it is just possible that it is a contraction from the *F. fleur d'affodille*." In respect of the second he says, "The French have inserted *r*, which is no real part of the word, and is a mere corruption. It is clear that the *E.* word was borrowed from the French before this *r* was inserted." Cotgrave (1632) gives it both with and without the *r*.

There can be no doubt whatever that the *d* in Daffodil is an escape or survival of the preposition in *d'affodille*. There can also, I think, be no doubt

FIG. 134.—CYPRIPEDIUM LAWRENCEANUM. (SEE P. 780.)

Those kinds which thrive in a cool and intermediate temperature constitute the greater portion of the collection. The following are a few of the most noticeable plants. Amongst the now numerous representatives of the most intensely coloured of all Orchids, the *Masdevallias*, is a grand plant of the very large flowered highly coloured *M. sanguinea*; a fitting companion to the above is *M. violacea*, an extra form of *M. Lindenii*, the singular *M. bella* and *M. Benedicta*, a very large-bloomed form of *M. ignea*, and an equally large-flowered, highly tinted variety of *M. Harryana*. These, in addition to the different species to which they are allied, were in bloom, and

there are good specimens of *O. Rossii majus*, *O. Dawsonianum*, *O. Hallii*, *O. triumphans*, *O. nebulosum*, *O. roseum*, *O. Roezlii* by the score, and several hundred *O. Alexandræ*.

Amongst *Cattleyas* there were some twenty-five distinct varieties of *C. Mossii*, one in particular, *C. Harryana*, which may be described as having a labellum as finely coloured as that of *C. Warneri*, and twice the size; *C. Reineckiana*, *C. Wagneri*, *C. Ruckeriana*, six or eight examples of *C. exoniensis*, one with immense broad leaves and large bulbs; *C. Warneri*, *C. gigas*, different forms of *C. labiata*, *C. Dawsoni*, *C. Schilleriana*, *C. maxima*, *C. Mendelli*,

that the *r* has crept in through some peculiarity of penmanship, which has led the printer astray, or is a perpetuated blunder of the printer himself. And further, it seems probable that the term was restricted to the Asphodel down to about the end of the fifteenth century or later, the Narcissus having since then acquired its name of Daffodil. In "*De Historia Stirpium Commentarii insignes*, Leonharto Fuchsio medico autore, Lvgdvni, 1547," under "De Asphodelo," p. 138, we read that the Greek and Latin, "Officinis corrupta voce Affodilius, Germanis Gold-wurtz (Gallice, Haste Royall) nominatur." The Haste royall is the *Hastula regia* of Dodoeus, Gerard, Parkinson, and others. It is the King's Spear, or Asphodel. This term is never applied to a Narciss. Moreover it cannot be, because the Narcissi produce their flowers singly, or in terminal umbels, whereas the Asphodels produce their flowers in a raceme, and this may be likened to a little spear.

In Lyte's translation of Dodoeus (1578, pp. 210-12), occur descriptions of four kinds of Narcissi, which are not classed as Daffodils, and in connection with these the term is used once only. In the paragraph devoted to "the names," he says, "These pleasant flowers are called . . . in Englishe Narcissus, white Daffodil, or Primerose pierlesse." As a genus, class, family, or tribe, they are not Daffodils, because they are not Asphodels. At p. 647 is a chapter "Of Affodyll," beginning "There be three kinds of Affodyll," and descriptions of three species of Asphodel follow. Under "the names" in this section we read, "This herbe is called in Greke ἀσφάδελος, in Latin Albucus and *Hastula regia*; in shops Affodilus; in French Hache royale, or Asphodel; of the common Herboristes of Brabant Affodilen. The flower with his stemme is called in Greeke ἀνθήρικος, Anthericos; and in Latine, as Plinie sayth, Albucum; in English also Affodyl, and Daffodyll."

From the older English botanists may be derived the suggestion that the Bog Asphodel (*Narthecium ossifragum*) may be attached to at least the fringe of the story of Narcissus. It is more of a water plant than the Narcissus of the botanist, and its geographical distribution answers all the requirements of the case. Gerard says it "groweth in moist and marsh places," and in Watson's *Compendium of the Cybele Britannica* (p. 335) it is assigned to "Europe all, except Turkey and Finmark." And there is yet another possible claimant in the Spanish Fritillary, which at p. 44 of Parkinson's *Paradisus* is referred to as commonly but erroneously regarded as a Daffodil. He says the misnomer is an "erroure growne strong by custome of continuance." To accommodate the story of Narcissus we need a plant that grows in or near the water, and the Narcissi of the modern botanist, though for the most part partial to water, are insufficiently aquatic in their habits to be properly known either as Narcissi or Daffodils. *Shirley Hibberd*, in "*Notes and Queries*."

### CEYLON SOILS SUITABLE FOR CINCHONA.

At the present time, when the attention of Ceylon planters is so generally directed to the growth of Cinchona, it may be convenient to suggest that the ultimate success will largely depend upon the character of the soil selected. Indeed already some practical men have pointed out in letters to the *Ceylon Observer* that it is not so much altitude as climate and soil that influence the success or failure of the several varieties of Cinchona. Thus Mr. Russell Grant, writing from Harmony estate, Pusselawa, under date of September 19, 1879, states that he has been planting *C. succirubra* at an elevation of 2000 to 2600 feet for two or three years, and that those planted in 1878 had reached the height of from 7 to 8 feet, and were all healthy and vigorous. On the other hand Mr. P. R. Shanil, *Ceylon Observer*, September, 1879, gives his opinion against *C. succirubra* being grown successfully under 2500 feet. Now it appears only reasonable to allow that the nature of the soil has a most important bearing from the growth of these trees, and capitalists would doubtless be quite prepared to make the necessary advances on a recently planted estate of Cinchona, if it could be practically shown that the local conditions of soil and climate were of a favourable character. It is much to be regretted that the Indian Government authorities at Madras have

not published any analyses of the soils of the Nilgiris plantations. This is the more to be regretted because the Ceylon planters have hitherto received so much valuable information from the publication of the official reports made to the Madras Government by the late Mr. McIvor. Strange as it may appear, the planters, although representing the most important element in the European population of Ceylon, have had to look to the Indian authorities for all information respecting Cinchona culture, rather than to their own local representatives of the home authorities. My friend Mr. Robertson, the Government Superintendent of the Madras agricultural stations, informs me that he is not aware that any analysis of Cinchona soil has been officially published, though he believes that the late Mr. Broughton made some prior to his sudden disappearance. It is to be hoped that something will be done in this direction, for to my mind it appears most necessary that before opening up land for such new products some definite details should be ascertained as to the particular kind of soil most suitable, as well as information respecting those descriptions of soil that have been found specially inimical to Cinchona.

I submit that capitalists will very properly require some more definite statement than that of the agent, who reports in general terms that the soil is friable or stiff. During my official tour through the principal Coffee districts of the island in 1877 and 1878, I observed the description of soil in which Cinchona appeared to do best, and from the reports I have since read, the opinion then formed, that a friable soil rich in nitrogenous organic matter was the most desirable for Cinchona, has been fully confirmed. Further, the dying off of Cinchona during the second year, which unfortunately has been too common in some of the districts, must be due to the stiff impervious nature of the subsoil, which does not allow the water to pass off. An accumulation of water causing a natural sourness of soil, seems as injurious to Cinchona as it is to Coffee. The following analysis represents the composition of a stiff impervious clay, which I personally selected during my tour. It occurred in a layer, 2 feet below the surface, and some 3 feet thick, and has been duly described in my official report to the Planters' Association, p. 151, but I think it would be interesting to give the details, with a view of pointing out the kind of soil that should be very emphatically avoided in the selection of new land intended for Cinchona.

#### Subsoil Injurious to Cinchona (air-dried samples).

Water lost at 212° Fahr. . . . .	2 580
*Combined water with a little organic matter . . . . .	20.220
Oxides of iron and traces of manganese . . . . .	22.206
Alumina . . . . .	30.356
Lime . . . . .	.084
Magnesia . . . . .	.063
Potash . . . . .	.077
Soda . . . . .	.094
Phosphoric acid . . . . .	Trace
Sulphuric acid, carbonic acid, chlorine, &c. { Not determined.	
**Insoluble silicates . . . . .	24.320
	100.000
*Containing nitrogen . . . . .	.048
**Yielding on subsequent fusion potash . . . . .	.482

This analysis shows us a soil containing over 50 per cent. of clay with 30 per cent. of alumina. There is a total absence of quartz crystals, which form so prominent a part in the majority of good Ceylon Coffee soils; moreover, there is a marked poverty in lime, potash, magnesia, and soda.

The insoluble silicates, unlike the insoluble portion of granitic soils, do not yield much potash on subsequent fusion, and in this respect form a striking contrast to the soils presently to be mentioned.

Passing on from the examination of this dangerous subsoil to the consideration of those soils which appear likely to prove suitable to Cinchona, it may be remarked that this is a subject which so far appears to have received little official attention from the agents of the Government; so far as I am aware no analyses of the famous soils of the Ilakgala Government Cinchona plantation have been made; and it is not known whether the several proportions of the valuable alkaloids produced from the bark have been systematically determined. Planters naturally look to Government for help and guidance in such matters, and at the present time of short Coffee crops Ceylon planters want all the assistance that can be given them with the aid of a Government chemist and botanist.

Soils naturally rich in decayed vegetable tissues, with a good friable texture and containing the important mineral elements in fair proportions, are those which

doubtless abound in the mountain regions of South America, where Cinchona flourishes with such prolific luxuriance. We should therefore make a selection of such land as seems best calculated to supply these natural advantages, and with a stimulating climate and a heavy annual rainfall there is every reasonable prospect that Ceylon will eventually be found admirably adapted to the production of bark rich in quinine. I beg, therefore, to direct attention to certain representative soils taken from different districts, some of which have already proved well suited to Cinchona.

#### Ceylon Soils Suitable to Cinchona (air-dried samples).

Name of District	Haputale, 4000 to 4700 ft.	Matale, 4250 ft.	Dimbula, 4800 ft.	Dimbula, 3200 ft.
Water lost at 212° F. . . . .	3.850	3.680	5.950	3.680
*Organic matter and water of combination . . . . .	8.750	11.860	13.444	8.380
Oxides of iron and some manganese . . . . .	6.798	7.631	9.265	4.530
Alumina . . . . .	6.502	8.969	12.108	4.993
Lime . . . . .	.266	.257	.136	.350
Magnesia . . . . .	.153	.576	.118	.216
Potash . . . . .	.139	.212	.173	.175
Soda . . . . .	.020	.003	.075	.062
Phosphoric acid . . . . .	.185	.140	.099	.147
Sulphuric acid . . . . .	.062	trace	.097	.003
Carbonic acid and chlorine . . . . .	*	*	*	*
Pure quartz crystals . . . . .	20.120	29.120	17.197	26.800
**Insoluble silicates . . . . .	53.155	37.552	41.338	50.724
	100.000	100.000	100.000	100.000
*Containing nitrogen . . . . .	.213	.328	.265	.219
**Yielding on subsequent fusion:—				
.. Potash . . . . .	1.941	1.853	*	1.767
.. Soda . . . . .	.246	.544	*	.754

If these analyses are carefully compared with that of the stiff clay already recorded, it will be seen where the differences in the composition exist.

Thus the free nature of the soil is very fairly indicated by the presence of quartz crystals, which varies from 17 to 29 per cent., as also by the relative low amount of alumina, the leading constituent of clay. The proportion of alumina in no case exceeds 12 per cent., as compared with 30 per cent. in the former analysis. The oxides of iron do not exceed 9 per cent., as opposed to 22 per cent., and we notice a much higher proportion of potash both in the quantity soluble in acid as well as a form ultimately rendered available by the decomposition of the at present insoluble silicates. Further, there is a relatively high proportion of phosphoric acid, of course not so high as in soil formed from sedimentary geological formations, but high as compared with poor quartz soils or stiff clays.

In the former analysis we could not expect much nitrogen, the clay being a specimen of subsoil taken at a depth of about 1½ to 2 feet below the surface; we cannot therefore compare the high amount of nitrogen which we see is present in these specimens rich in humus with the small quantity found in the clay. The comparison would not be a fair one, being a subsoil, and the others surface ones. We may remark that the percentage of nitrogen will be an important point for consideration in judging of the relative advantages of different samples of soil on new estates.

At a recent meeting of agriculturists held at the Society of Arts, Mr. Pell, M.P., remarked that in the selection of a farm he should inquire very closely into the character of the soil; while Mr. James Howard, M.P., stated that it was very remarkable how few people realised the importance which agricultural success had on the financial condition of a country. It is a melancholy reflection, when riding through an abandoned Coffee estate, to speculate on the number of valuable lives and fortunes that might have been saved had more attention been directed to the selection of really good land among the early pioneers in the hills of Ceylon.

Let us hope that, in the opening up of new land for Cinchona, men will first ascertain what kind of soil is the most suitable for this purpose, and that in order to enable them to gain such information, the Government will render every available assistance. *John Hughes, F.C.S., F.I.C., Analytical Laboratory, 79, Mark Lane.*

THE SOCIÉTÉ CENTRALE D'ORTICULTURE DE FRANCE has obtained permission from the French Government to add another adjective to its already long title—that of "Nationale." The new title of the Society will therefore be Société Nationale et Centrale d'Orticulture de France.

\* Not determined.

SELECT INDEX OF PLANTS FROM 1841 TO 1878.—(Continued from p. 685.)

## PLANT GOSSIP.

**CYPRIPEDIUMS.**—We are indebted to Messrs. Veitch for permission to use illustrations of two hybrid *Cypripediums* raised in their establishment, and which are of interest scientifically as illustrating practically what in all probability occasionally occurs in Nature. The botanist dealing with native specimens has but few clues to guide him in such a case, but these artificially produced hybrids, by showing what is possible, and in what manner and to what extent variation is possible, may render great service. To be of use for this purpose, however, the process of fertilisation should be carefully and judiciously effected, with a definite object in view, and in all cases the parentage should be exactly recorded. As ornamental plants these hybrids afford a pleasing variety, but in this particular genus we cannot say that the offspring exceed the parent in beauty. The two varieties figured are—

*Cypripedium selligerum* × (fig. 133) is a very fine hybrid raised from *C. barbatum* and *C. levigatum*, but quite distinct from either. The habit of the plant is bold and massive; the leaves are broader than in *C. levigatum*, and show but faintly the markings and mottled appearance of *C. barbatum*. The scape is erect, and bears two and three flowers larger than those of either parent. The upper sepal is white, with broad blackish-crimson veins; the inferior sepal smaller and whitish. The petals are about 3 inches long, deflexed, with a partial twist, and traversed by crimson veins. The lip or pouch is nearly as in *C. barbatum*, but much lighter in colour.

*Cypripedium vexillarium* × (fig. 134) was described in our columns by Professor Reichenbach in 1870, p. 1373. It is a very beautiful and distinct hybrid Lady Slipper, raised at Messrs. Veitch's nursery by Mr. Doiny between *C. barbatum* and *C. Fairieanum*, the latter being the pollen parent. It is thus described by Professor Reichenbach:—"The flower is large, the upper sepal whitish, with port-wine coloured veins, washed with purple, a little green at its base, with some transverse ascending nervules; the inferior sepal much shorter, narrower, and more pallid; the petals deflexed, bluntly acute, with hairs around the limb and some warts, and the lip nearly as in *C. Fairieanum*. Messrs. Veitch remark that the habit of the plant is very dwarf, the large size of the flower very striking, while its distinct and beautiful markings cause it to be universally admired.

*Cypripedium Lawrenceanum* (fig. 135) is a species discovered by Mr. Burbidge in Borneo, and by him introduced into Messrs. Veitch's establishment. It was described by Professor Reichenbach in our columns in 1878, vol. x., p. 748. From that description we quote the following particulars:—"The leaves have on their upper surface a dark green mosaic on a light green nearly whitish ground. The flower is equal in size to that of *C. barbatum majus*. The upper sepal is white with purplish shining veins which run to the edge. The petals are narrow, purplish at the top, and with the usual fleshy dark warts on the limb. The lip is very large, purplish-brown above, yellowish below, covered with very numerous warts internally. The stamnode is a special ornament." It is, according to Messrs. Veitch, very free blooming, and, whether for its distinctly marked foliage or its fine flowers, it must become a very popular Orchid.

— **LILIUM LONGIFLORUM AS A MARKET PLANT.**—Messrs. Beckwith & Sons, of Tottenham, are now sending into the market plants of *Lilium longiflorum*, growing in 48-sized pots, that are most admirable as examples of successful cultivation. Probably three bulbs are in each pot, and they have thrown up between three, four, and five main shoots, and on these can be counted from seven to ten flowers of large size. The flower-stalks are clothed with green leaves quite down to the base, and nothing more can be desired in the way of health and vigour. That such plants should command a ready sale at good prices is only natural. These Lilies are well adapted for the decoration of the greenhouse at this season of the year, and if well cared for will remain in flower for a considerable period.

— **LILIUM UMBELLATUM.**—This also makes an excellent market plant; and, being well grown, the stout stems are crowned with large trusses of erect orange-brown flowers. But it does not sell like the white *L. longiflorum*. There is something peculiarly fascinating about the pearly delicacy of the white flowers that the orange form lacks, and yet it is very useful. The market growers do good work in that they are demonstrating the adaptability of the Lily as a pot plant for general decorative purposes.

Hitherto gardeners have confined their attention mainly to *L. auratum* and the varieties of *L. speciosum*, but a much wider range is possible.

— **RHODANTHES IN POTS.**—The mode in which these are grown for market, and the admirable pot plants they make, was dwelt upon in these columns a short time since. The durability of the plants when kept in a house and carefully tended is deserving of record. Plants a month old look as fresh and attractive as when brought from market. It is simply necessary to give them a cool spot, to water sufficiently but not immoderately, and to cleanse the leaves from dust deposits so far as it can be done without injuring them. A good specimen, carefully preserved, has on it from sixty to seventy large flowers growing on some eight or nine plants in a 48-sized pot, and when the foliage shows signs of decay, and becomes unsightly, the flowers will be capable of further service, if they are cut off with stems 4 inches or so in length, tied into bundles, and allowed to hang heads downward till the stems become rigid. They can then be put away till autumn and winter cause flowers to be scarce, and the pretty everlastings will then do good service in the way of decorating vases, &c. *R. maculata atrosanguinea*, with the dark ring in the centre of the flowers; and the pure white *R. alba*, are the two best for winter decoration, as they are two largely grown for market.

— **IVY-LEAVED PELARGONIUMS FOR CONSERVATORY DECORATION.**—No one visiting the Chiswick gardens at the present moment can fail to be struck with the beauty and fitness of these useful plants for conservatory and house decoration generally. In common with the market growers, Mr. BARRON shows what can be done in a 48-sized pot, and he produces nice and symmetrical plants 2 to 3 feet in height, tied out key-shaped, and loaded with leaves from top to the bottom. These Ivy-leaved Pelargoniums are very free and continuous in bloom, and, as far as the most desirable varieties are concerned, a visit to Chiswick for the purpose of making a selection would be time well spent. In the collection are several varieties of M. Lemoine's raising, to one of which a First-class Certificate of Merit was recently awarded. The new forms are characterised by flowers of large size and of greater depth of colour than has been seen previously. The double varieties are of great value for cutting from.

— **M. VALLERAND'S GLOXINIAS.**—A French correspondent writes:—"I think the seedlings exhibited in Paris by this gentleman are well worthy of a special notice. They are all good, but to describe them all (over a hundred varieties) would take up too much of your space. I shall, therefore, only refer to the more striking varieties. All the plants shown, without exception, were very vigorous, and had large leaves and large flowers. Few are as yet named, the remainder being only numbered. On the opening day of the Paris show, Saturday, the 5th inst., when the President of the Republic inspected the flowers, his name was given, with his sanction, to one of them, and a second was named after his daughter, who accompanied him. We have, therefore, now a *Gloxinia Jules Grévy*, and one *Mlle. Grévy*. A new large-flowered variety bears a name as well known as that of President Grévy—*Baronne Alphonse de Rothschild*, a fine pink variety, spotted with a darker shade. *Mons. A. Lavallée*, lilac, white margin; *Charme de Lutèce*, spotted pale lilac; *Mlle. Angéline Martin*, dark pink, spotted white, and white margin; *Feu Eternel*, firey red, very bright, with the margin a shade paler; *Cornelie*, throat spotted lilac, margin lilac; *Mons. Fritz Kreechlin*, violet spots; *Marcel*, quite a new style in the way of the spots—petals dark red, spots darker shade, but with a white dot in the centre of the spot; *Leopard*, same thing, with the exception that it is violet instead of red. It is almost impossible to describe the extraordinary colours and markings of these novelties; a painter only could do justice to them.

— **ASPLENUM VIRIDE IN VERMONT.**—Mr. Hart, King's House, Kingston, writes:—"It may interest your correspondent, Mr. Dod (see p. 460, vol. xiii.), to know, that this *Asplenium* and *A. Trichomanes* are both found on this side of the Atlantic—*A. viride* being found in Vermont, U.S.A., and *A. Trichomanes* in Jamaica, at an elevation of 4000 feet. As the two species are

here considered to be very distinct, it may not be amiss to consider whether the species here found under these names may not differ in some degree, specifically, from those of the Old World, and I for one should be thankful to Mr. Dod for his description of the two species found by him. The following is Grisebach's description, quoted from his *Flora of the British West Indies*, of *A. Trichomanes*, for comparison:—"Leaf pinnate; leaflets oval, crenate, cuneate, or truncate at the oblique or upward produced base, lowest sub-distant, smaller; rachis scarious-margined, veins few, simple, lower (or most) forked; petiole, black; sori, oblong (or half oval), intermediate between the margin and the flexuose midrib." It should be added, that the lower leaflets are sometimes deltoid. *Asplenium viride* has, on the contrary, leaf pinnate, sometimes alternate, ovate, deeply crenate, cuneate at the base; rachis angular, furrowed on the upper side; petiole, bright green, darkening into brown at the base; sori, oval-oblong, intermediate between the margin and midrib. It will thus be seen that the two differ in a great degree by description, and more so in their general appearance, when the specimens are before us.

— **LAMIUM LONGIFLORUM.**—Messrs. Backhouse send us specimens of this plant which has much the aspect of an improved edition of our common purple Dead Nettle. The stalks are rich claret coloured; the stem-leaves are on very long stalks, sub-cordate, ovate-acute, and coarsely crenate. The flowers are purple, and over 1 inch in length. The plant is a native of Southern Europe.

— **ODONTOGLOSSUM VEXILLARIUM.**—There is a grand plant of this fine Orchid in splendid flower just now in Dr. Paterson's choice collection at Bridge of Allan, N.B. It was quite a small plant with one bulb when Dr. Paterson got possession of it, about four years ago. It is now a fine plant, in vigorous health, with several large and well matured bulbs, showing that it has received treatment which suits it. One bulb bears four spikes, with twenty-nine blooms upon them. The plant bears fifteen spikes, having no less than 111 blooms in all, and presents such a display of flowers as has seldom or never been seen in cultivation on this beautiful Orchid. The flowers are large in size, of good substance, and of a rich dark colour. It is a sight worth a long journey to see. But to the lover of Orchids there are many other attractive and choice specimens to be seen in Dr. Paterson's collection. A fine branching variety of *Aerides Fieldingii* is bearing five splendid spikes of flowers, two of which, springing from opposite sides of a stem, measure from tip to tip 32 inches across. *Chysis bracteosa*, just going out of flower, has some wonderful bulbs, measuring some 27 inches in length, by about 9 inches in circumference, with young growing bulbs promising to be even more robust. A small plant of the lovely *Phalenopsis Parishii* is bearing a profusion of its beautiful porcelain-like flowers. The best varieties of *Masdevallias* are also growing and flowering freely. Among other noteworthy plants a magnificent specimen of the Elk's-horn Fern, *Platycerium grande*, is throwing out a vigorous fertile frond, and likely to ripen a good crop of spores. The white-flowered *Anthurium Williamsii* is also in fine condition, the spathes large and pure white in colour. A grand plant of the best variety of *Anthurium Scherzerianum* has produced considerably over a hundred flowers this season, and is still in fine bloom. *Disa grandiflora* is also particularly vigorous and finely flowered.

## SUBURBAN GARDENS.

It often makes me sad as I ride through the suburbs of the town where I live, and see, as I constantly do, how very little use is made of the plots of garden ground which are attached to most of the houses by which I pass. The railway on which I daily travel is high above these gardens, and so they are open to mine and every traveller's gaze. I often wish one could do something to teach their owners how to make the best of them. I have wished this so often that I have at length determined to make an attempt. I will try to tell what I have done myself, and others with wider experience may possibly be induced to follow my example. By persistent effort perhaps we may produce an impression, and these neglected plots may in time be brought under decent

cultivation. I also want to tell my experience of growing alpine plants. I have had so much pleasure in their cultivation, they are individually so beautiful and interesting, they are such subjects of admiration to all who see them growing in my garden, that in the hope of being useful to other suburban residents whose gardens, being small and near the dwelling-house, it is a matter of some importance to keep neat and tidy at all seasons of the year, I gladly give the details of my experience and practice.

I live in a road in a pleasant suburb, 3 miles from the centre of a town numbering more than a quarter of a million of inhabitants, and where of course smoke prevails, for besides the chimneys of the miles of houses there are innumerable stacks at many factories large and small, belching forth their black streams

thousands of others near large towns, where houses are built closely together, and where, land being dear, gardens are limited in extent. The soil is a sandy loam, with a gravelly subsoil running downwards for many feet and overlaying a bed of clay of varying density. I laid out the garden myself, and in doing so went to some expense in making the flower-garden part of my plot as capable of growing most sorts of hardy plants as possible by carting in many loads of the best turfy fibrous loam obtainable in the district. This cost money, but I am convinced that I acted wisely, and the vigorous healthy growth of a rather numerous and widely-diversified collection of the smaller Coniferae, particularly Retinosporas of eight or nine sorts, Aucubas, deciduous flowering shrubs, many kinds of herbaceous plants, bulbs innumerable, and about a

has taught me that even what is often regarded as a disadvantage—I mean the nearness of overshadowing buildings—is capable of being turned to advantage if suitable plants are selected to fit into the circumstances of the position and its surroundings.

Supposing my readers to be traversing my little garden by my side, we shall have proceeded along the walk till we have passed the buildings and reached that part where the greatest width of my garden commences. The wind of the walk which inclines southwards then runs parallel to the wall on the south side, leaving a narrow border on the left hand with a due north aspect, which is most valuable to me, and where I raise a large quantity of pansies from cuttings annually. The left-hand corner at the extreme east is occupied by a fernery, where I have some excellent specimens of common hardy Ferns. A very small grass plot runs from the right of the walk to the edge of the border made beneath the wall on the north side of the garden, and is somewhat Pear-shaped, the stalk end being of course towards the house. This shape is obtained by the border, which curves gently along its length, sweeping right across the lawn, with a nearly semicircular line on the side nearest the house up to within 9 inches of the walk, between which and the border (here about 14 feet wide) a narrow verge of turf runs on continuously, and joins the turf of a small croquet lawn 40 feet long, with straight flower borders on three sides and the walk on the other. I am afraid these details will prove tedious, but I give them because I think they will be found suggestive of how a narrow plot of garden behind a suburban house may be utilised to great advantage and made to appear, as seen from the house, to be very much larger than it really is, giving a sense of openness and extent most exhilarating in its effects, and affording scope, even in a limited area, for the judicious use of a considerable number of plants.

I will here, for the sake of plainness, recapitulate what spaces of border I have for growing plants in. First, then, I have a continuous border of varying width under the wall on the north side of my garden 120 feet long, running alongside the two grass-plots; at 66 feet from my house the border widens to 14 feet, and, as already stated, divides the Pear-shaped lawn and the croquet lawn. At the west end of the croquet lawn is a bed of Roses; beyond this is a plantation of pyramidal fruit trees, forming a background to the flower garden, and shutting off the kitchen garden, which lies beyond, but of which, not coming within the scope of this paper, I need say nothing further. Starting again from the house, I have on my left another border of varying width, almost always in shade, and a narrow north border running the entire length of the two grass-plots I have mentioned. On the Pear-shaped grass-plot I have two beds, one long and narrow at the stalk end of the plot, which in summer is either filled with carpet or ordinary bedding plants, and in autumn is planted with bulbs and other spring flowering plants—Daisies, Myosotis, Wall-flowers, &c. The other bed is at the other end of the grass-plot, and is circular in shape, harmonising with the curved border. On this same grass-plot I have a fine clump of Pampas-grass.

After all this introduction I come now to how and where I grow my alpine plants. In order to save trouble in keeping the edge of the turf and to raise my border 12 inches above the level of the walk and grass-plots, I placed an edging of slabs of red sandstone broken smooth on the side nearest the turf, but irregular in its top surface line so as to avoid monotony in appearance. I then made triangular pockets in the border by pressing in other pieces of sandstone. Where the space was sufficient, I had two rows of these pockets placed one behind the other. The appearance before planting was somewhat thus,  $\overline{WWW}$  where a single row is used; thus where a double row,  $\overline{WWW}$ . The divisions between the pockets were made with pieces of sandstone

8 to 10 inches deep in the ground, and 2 to 4 inches above it. The whole of the border being filled with good turfy loam, I had simply to add sufficient to each pocket to nearly fill it to be ready for planting a very large proportion of the alpine I commenced with; and there being a depth of 18 inches of the good soil, I have never during the three years which have elapsed since I made the pockets had the least trouble in growing luxuriantly most of the alpine I started with. Where needful, I mixed peat, sand, broken sandstone, lime rubbish, limestone, &c., with

FIG. 135.—CYPRIPEDIUM SELLIGERUM. (SEE P. 780.)

unceasingly. My suburb is on the south side of the town, and is less affected by the smoke than those situated on the other sides. I give these particulars, because I want to show that my success is not due to exceptionally favourable situation, though I at the same time acknowledge that I am favourably situated compared with residents in some neighbouring suburbs who get a larger supply of smoke than falls to my lot. My flower garden runs east and west, the house being at the east end. My house is so built, that the part of my garden nearest to the dining-room window is narrowed to about 20 feet wide for a length of 14 yards by the kitchen and other domestic offices; it then opens out to 30 feet wide. On the north side it is bounded by a wall 7 feet high; on the south by another rather lower.

It will thus be seen that the surroundings and circumstances of my garden are similar to those of

hundred sorts of alpines, are living and truth-telling witnesses to the fact.

A gently winding walk runs from my house past the out-offices, planted on each side by a continuous border varying in width with the wind of the walk. The border on the left is mostly in shade all day long except in the height of summer time, when in the afterpart of the day some pleasant gleams of sunshine brighten it up. The right hand border is fully exposed to the south, except the part nearest the house, which is, of course, shaded by the opposite buildings, save when the sun has a good altitude and has reached the south; so that in the morning it is only a part of the south border which is sunny; the most eastern end is then in shade, but as the day advances the shade gets smaller and smaller, until at last the whole of that border is lit up with sunshine. I give these minute details because my experience

the soil in the pocket. Occasionally I have removed the soil and entirely filled pockets with a special compost suited to the plants I intended planting. These variations from my general plan were comparatively few in number, and I have found the turfy soil answer in most cases admirably. All through the spring and summer I occasionally sprinkle a little suitable soil among such plants as seem to need it, endeavouring thus to imitate what is done for them in their native homes on the mountain sides by every fall of rain. My pockets are now all filled with healthy plants; the stone is almost entirely hidden by the luxuriant growth of the plants, or where still uncovered by them has become weather-stained, while mosses and lichens are in many places adding to the beauty of its appearance. The pockets commence at the stalk end of the Pear-shaped grass-plot, and extend round its entire extent, along the side of the border dividing the two grass-plots and along three sides of the croquet lawn: thus by contrivance I have over 200 pockets. The circular bed is raised a foot or more above the grass-plot, and is edged all round with three tiers of pockets rising one above the other. These are filled with alpine in robust health. These diminutive plants are preserved from interfering with, or encroaching on, each other by the stone boundaries of the pockets, and when a plant has grown too big for its place by lifting out the separating stones it can easily be taken out, divided and replanted. This pretty fringe to my borders, consisting of a varied collection of low-growing plants, is a source of unceasing pleasure. It constitutes a lovely line of demarcation between the grass-plot and the border at the back, which is filled with shrubs and herbaceous plants, with climbers on the wall, Roses, Clematises, Ivies, &c.; it is always tidy, or easily made so; it gives me during many months of the year a succession of charming flowers of exquisite beauty; when the flowers are over the plants still adorn and beautify my little garden by the charms of their varied styles of growth. By making proper use of the different aspects—I have pockets exposed to all the points of the compass—I am able to meet the requirements of such plants as like shade partial or continuous, as well as those needing full exposure to the sun, so that no spot in my flower garden is or need be untenanted. I have among my plants many souvenirs of my annual holidays flourishing about me. Thus whenever I spend an hour in my garden I am constantly reminded of pleasant rambles in the lake-country, or Wales, or wherever else I have spent a holiday. It is beyond my purpose to say in what other way my flower-plot is furnished, except that by using the abundant resources cheaply available nowadays to every one, I have been enabled at no very great cost to make a piece of ground of limited area sufficiently tenanted with things of beauty that are also joys for ever, to afford me infinite pleasure during such leisure hours as I am able to devote to my garden.

*Philanthes.*

## Florists' Flowers.

**POTTING AURICULAS.**—There must needs be differences of opinion among Auricula cultivators as to the best time of the year for potting Auriculas. For my part I like to get as many of my largest plants as I can, and especially the late blooming varieties, potted as early as convenient. I reported some eighty or ninety of my plants in Whit-week, a few more since, and the remainder will, I trust, be all potted by the end of July. I think it is of great advantage to the plants to get the roots that are put forth directly after repotting at work as soon as possible; and my experience leads me to believe that the more thoroughly the plants are established by October, the more safely are they carried through the winter, and the better do they flower in April. Perhaps it is best for me to pot early, as I have to winter plants in a north house where no gleam of sunshine visits them in their wintry quarters; and the surroundings are cold and cheerless during December, January, and February. The pots planted in May are now looking as well as one could desire them to look.

In the course of four or five years' culture of the Auricula, I have had to sustain losses, and I find they occur with more frequency between blooming and potting times than at any other period. Any one observant of the Auricula will know then there is

always a tendency on the part of the plants to thrust themselves up out of the soil, and on that unbent part of the stem between the soil and the lowermost leaves many of the sorts show a tendency to put forth roots. This activity I find in many cases to be indicative of defective root-action below the soil, and it is of decided advantage to such plants to cut away the old roots or a good portion of them, and trust for their sustenance to those that will be newly made.

The fine plants Mr. Turner will often produce in quite small pots, serve to point an argument in favour of under rather than over potting. I have noticed that the finest quality of bloom is to be seen on such plants. The late George Lightbody once remarked, when giving seasonable advice to cultivators, "Pot in sizes suitable to the habit of the plants; a 6-inch pot is large enough for the most robust: plants of smaller growth should be in pots of lesser size." I never attend the exhibitions of the National Auricula Show at Manchester without being struck with the large size of the pots in which some of the Northern growers have their plants; and this is equally true of the Poly-anthuses as well as Auriculas. No doubt the pots are well drained, but still the size of the pot in many instances appears to be disproportionate to that of the plants.

Another of the late Mr. Lightbody's items of advice and counsel was that "In potting arrange the fibres so that they may at once come into contact with the sides of the pots." To assist in giving effect to this advice it is well to make a slight mound with the soil, resting the base of the carrot on the apex of the mound, with the roots falling away slightly to the sides of the pots and reaching to them. When the roots are gathered together in the form of a mass or coil in the middle of the soil it takes time to force their way to the circumference of it, and we know by experience that when the roots are working vigorously about the sides of the pots the plants are doing well.

Who can sufficiently estimate the importance of good drainage? It should be provided by means of a piece of crock laid over the hole in the bottom of the pit and large enough to cover it, and then filling in to the depth of half an inch or more with pieces of broken crocks, decreasing in size till the quantity is provided. A thin layer of fibry turf placed next this prevents the soil from being carried down among the crocks and stopping up the free exit of water—for when this occurs a soddened and sour soil is inevitable. In regard to soil a good fibry loam, yellow and soft to the touch, pulled to pieces and not sifted, some coarse white sand, a little charcoal beaten small, and some well-decomposed manure from a spent hotbed makes an excellent compost. I have not mentioned leaf-soil, because it is not always easy to procure it, and bad leaf-soil will do much more harm than good. It is important to use clean pots, and if they are new and have been exposed to the air they should be well soaked in water before using.

My newly potted Auriculas are in a cold frame on a north aspect, having a cool ash bottom, on which the pots stand. It is a shallow frame, and therefore the plants are near the glass, but plenty of air is given by tilting them open towards the north. A little of the morning and evening sun falls on the plants, otherwise they are kept cool and shady. They are kept watered, but not drenched; the decaying leaves are picked off, the surface-soil is occasionally stirred, and if any greenly put in an appearance they are brushed from the leaves. When the weather is cool and shady the lights are thrown open, and gentle showers are allowed to fall on the plants. *R. D.*

## Natural History.

**A WHITE ROOK.**—It will no doubt be interesting to ornithologists to learn that a white rook was captured here a few days ago. It was a full-grown and strong young bird of the season. The whole of the body is pure white, with the exception of the larger feathers of the wings and tail, which are slightly and delicately shaded with light brown; beak and claws ivory-white. This singular freak of Nature is, I believe, of very rare occurrence. *Geo. Griffin, Slebeck Park Gardens, Pembrokeshire.*

## Garden Operations.

### KITCHEN GARDEN.

**CELERY.**—Although the season for this highly prized esculent can be advanced considerably by resorting to artificial means for the purpose of preparing the plants, yet when this is done, and the most generous treatment has been accorded to its cultivation, it is scarcely in a condition to be used in a

raw state, though for culinary uses, however, it is indispensable. For practical reasons it may with propriety be divided into three sections or crops, which should be raised so as to come into use successively. The first crop being somewhat precarious in its nature and limited as to quantity, enough seed for the purpose can be raised by means of pots or a seed-pan. The seed should be sown about the end of February in rich soil which is light and fine, and be covered over very thinly with a like compost, which should be kept constantly moist by watering, and keeping it covered with a thin sheet of paper until such time as the seed vegetates, after which it should be exposed to light and placed in close proximity to the glass, in order to prevent the plants from drawing up weakly. As soon as these are fit they should be pricked out 2 or 3 inches apart into pans or boxes, or otherwise into a frame having a genial heat from fermenting matter, and be kept moderately warm until the plants are established, when a cooler temperature and more air should be given to them until the conditions out-of-doors will admit of their being placed in the trenches which have been prepared for them; this may safely be done about the middle of May.

The second crop is the main or general one and the most important of all, as from this the chief supply is drawn to meet the demands throughout the winter months. The time of sowing seed for this varies with different growers, as also does the method of rearing the plants afterwards. I maintain that in the case of an indigenous subject like this, when it is required for the purpose of being grown in a natural manner, that the plants should be reared under conditions as nearly normal as possible; I therefore advocate and practise this plan, by sowing the seed about March 25, in light rich soil in a warm and sheltered spot in the garden, and when the plants are fit for pricking-out—which is as soon as they can be handled—they should be done. This operation is carried out likewise under the same conditions, on a flat or border which is suitable for the purpose. These are means which may be relied on to produce plants of a sturdy and hardy nature, and far preferable for the purpose to those which are raised under other and more luxurious circumstances. The third and last sowing should be made about April 1, as this crop is mainly intended to prolong the season, and more often than not is required almost entirely for culinary uses; for this reason, as well as on account of the lateness of the season, it never attains to a large size, and consequently less room for it is allowed in cultivation. Either shallow trenches, made about 2 feet apart, or deep drills made in rich ground with a hoe, will answer the object in view, of course assuming the plants have beforehand been prepared in a similar way to those of the foregoing section.

The chief element required in the cultivation of Celery is manure; this should be thoroughly decomposed, and of the strongest and best description, such as accumulates about the home-stalls where cattle are fed and fatted. If this material be thrown together, and permitted by the process of fermentation to become sweetened and purified, it is the best that can be had for this purpose. In addition to this, the plants will further, as growth proceeds, derive support from an occasional application of moderately strong manure-water in a diluted state. In order to obtain fine heads of Celery I prefer single rows, because the attention required afterwards can be more expeditiously and properly carried out, and, moreover, the plants are not liable to be drawn up too rapidly. Double rows are sometimes introduced into single trenches, which are made somewhat wider, and in this way a larger quantity is secured where only a limited area is available. Another plan is that of making a large trench 4 feet wide or more, the plants so placed as to be in lines every way at from 6 to 12 inches apart, so that in the process of earthing-up boards can be used; this method requires the soil to be made fine beforehand, and much care is needed to avoid the soil getting into the hearts of the plants. This observation is likewise applicable under any method of cultivation. One plan of earthing-up is to carefully gather the leaves of the plant, tie them loosely with soft matting, and then draw the soil round them carefully by hand, adding the rest afterwards in a general way; and where Celery is extensively grown this plan is chiefly adopted. In making trenches the soil should be taken out about 9 inches deep and 1 foot wide for individual rows, and proportionately for combined ones; this should be evenly spread over the intervening space between them, and a dressing of the sort of manure before described should be laid in them from 6 to 9 inches in thickness, and be turned in with a fork or spade before it becomes dry. After this the planting can be proceeded with by lifting the plants from the bed with a ball of

earth attached to them, and planting them firmly at from 6 to 12 inches apart according to circumstances. If very fine sticks are wanted, more space must of course be given to them for growth. When the planting is completed water at once in a manner to settle the soil well about the plants, and to saturate it completely around them. As far as practicable the planting-out should be done when the plants are about 4 inches in height, as they take to the soil much more readily at that stage, and moreover, when they are much larger it necessitates topping them, an operation which should be avoided if possible. In defining the distances apart between the rows regard must be had to the nature of the soil and other circumstances. In light friable soils more space is required than in retentive ones, because in the latter the ridges required in blanching it can be made more erect: as a rule they should range from 4 to 6 feet apart. During the early period of growth plentiful supplies of water should be given at all times when circumstances demand it.

The most destructive pests that infest the Celery crop during the growth are slugs and the Celery-fly; the devastation caused by the latter formidable enemy is appalling. The only sure means to arrest its progress is by keenly looking after it betimes, and picking off the affected parts. To mitigate the ravages of slugs, which are more or less damaging, a good dressing of soot, with a little salt intermixed, applied over the surface of the ground prior to its being used for the crop, will destroy all those with which it comes into contact. Out of many sorts of Celery which are in cultivation I may safely recommend Turner's Incomparable or Sandringham White, which are the same in my opinion; as a dwarf white kind Haywood's White Queen is also an excellent sort for certain localities, and so is Cole's Crystal White. In the red and pink section Leicester Red stands pre-eminent; Major Clarke's Red is undoubtedly the same; Williams' Matchless and Ivery's Nonsuch are likewise sterling sorts — Manchester Giant for a very large kind.

**ORDINARY WORK.**—Among other matters, the recent severe frost, which materially damaged the rows of Scarlet Runners, French Beans, and Vegetable Marrows, which were exposed, and likewise nipped the leaves of Potatos, will necessitate the planting of those to be sown to supplement them at the earliest period possible. The growth of stock plants should be fostered in every possible way, and every care and encouragement be afforded them when they are planted out. A visitation like this practically shows the caution that is necessary before fully exposing subjects like Gherkins, Cucumbers, Vegetable Marrows, &c., and points out the advantage of elevating hand-glasses, and similar contrivances which are placed on such subjects before finally removing them; where this has been done, merely the points of the plants have suffered, and the rest remains uninjured. Give regular attention to watering all succulent crops, as Lettuce, Endive, early Celery, &c., and to all seedling crops likewise. As late crops of Peas advance, stick them erectly, and for these employ stout sticks. If not already done, sow a breadth of Carrots in light friable soil, and of dwarf Beans for autumn use. Lettuce seed should now be sown in drills thinly, to be thinned out afterwards to the requisite distance apart. Keep the hoe going over the surface of the ground as often as time and its condition will admit. *Geo. Thos. Atles, Wycombe Abbey.*

**FRUIT HOUSES.**

**VINES.**—The thinning of late Grapes of all kinds should be finished without delay. Hamburgs intended for use through November and December will require more thinning than is necessary or advisable where the Grapes are used before the leaves fall, and small or medium-sized bunches through which the air can pass freely will be found better keepers than large ones. When the berries begin to swell freely all weak laterals may be allowed to grow, but the strong ones will require close stopping and tying down to keep the sap evenly distributed, and to secure firm, short-jointed wood that will be likely to ripen well. The most forward Lady Downe's, as well as the general crop of Muscats now about stoning, will require close attention to prevent what is termed scalding, a disease which frequently affects berries upon which the sun never shines. It is always the most troublesome in catching seasons, when we have sudden changes from heat to cold, and it is aggravated by a low temperature followed by a rapid rise before air is admitted on bright mornings, when, the berries having become cold through the night, moisture is condensed, and the cuticle on one side is injured. To counteract the evil a warm, dry, buoyant atmosphere should be maintained through the night with increased ventilation before the temperature begins to rise on fine mornings. Scalding extends over about fourteen days when Vines are in good health, and a little longer when the roots are in cold sluggish borders. The fine rains we have had in this part of England have been of great service to external

borders which were not well mulched, moreover they have filled up our tanks, and, as a matter of course, the surplus water has been given to the inside roots in preference to allowing it to run into the drains. Vines in all stages carrying advancing crops will now take large quantities of water of a stimulating nature. The best for general watering is warm diluted liquid from the manure heap, but where this cannot be obtained Clay's Fertiliser or guano act upon the foliage in a most satisfactory way, and good foliage is an important aid to the production of good fruit. Where the earliest Vines, having the run of external and internal borders, require renovating, one or other of these may be taken out as soon as the crop has been cleared. An important point in the successful lifting and relaying of roots at this season is dispatch, and, to prevent delay, when the work is taken in hand new composts and drainage should be ready and within easy reach. The house should be kept moist and shaded to prevent the roots and foliage from suffering during the operation of lifting and re-arranging the borders. When all is finished the roof will require shading on bright days, and the Vines will be the better for frequent syringing, with a close moist heat from solar influence, in preference to firing until new growth is perceptible, when the ordinary treatment may be resumed, and they will be in a fit state for starting in December. If it is thought advisable to replant early houses, vigorous young Vines from this year's eyes may be planted, with every chance in favour of their filling the house. A narrow ridge of compost will be sufficient for the first year, plump buds for pruning back to will ripen near the base, and these will throw up strong fruiting canes next season. *W. Coleman, Eastnor Castle.*

**ORCHARD HOUSE.**

In the late house the trees are now going through the stoning period, and as they are also making young wood very freely it is necessary to pay attention to them daily. If the surface dressings have not been applied see to it at once; for vigorous roots are thrown out at this time, and unless they have fresh strong stimulants to run into this month the fruit will not be full sized. At p. 719 the most suitable compost for surface dressing was described, but we have not been able to obtain the malt or kiln dust, and have merely used good rotten stable manure and loam, in equal proportions, with a handful of Clay's Fertiliser to each bushel of the compost. Syringe the trees well twice daily, and shut up the house as soon as it is possible to do so in the afternoon. The Strawberries are nearly over; we have still Frogmore Late Pine and Loxford Hall Seedling, which we hope will not be over until Black Prince is ripe out-of-doors. As soon as the fruit is gathered from the Strawberry plants we turn them out-of-doors, and either throw them away or plant them out in the open ground. In the early house syringing must be discontinued of course, as the ripening fruit would be injured thereby. If the trees have not been kept quite free from red-spider up to the time of leaving off the use of the syringe the pest will spread with the most amazing rapidity, and very much injure the leaves before the fruit can be gathered. Some persons leave the fruit on the trees until it drops off into nets or bags, but I question whether this is the most desirable plan. Those who are accustomed to gather the fruit know by its appearance when it is about the right stage to gather; the fruit should then be taken carefully from the trees and placed on a layer of cotton wadding which has been placed in the bottom of a flat basket. As soon as the fruit has been picked from the trees no time should be lost in giving them a thorough washing with the garden engine. *J. Douglas, Loxford Hall.*

**PLANT HOUSES.**

**ORCHIDS.**—From now till the end of July, or perhaps even till the end of August, that section of Orchids termed "cool" will give the grower more anxiety than the "intermediate" and "hot" put together. The anxiety will be caused more by the supposition that these plants cannot stand the heat of our English summers, rather than by any facts that can be brought forward from past experience. It is quite an erroneous idea to suppose that loss and yellowness of foliage is caused by sun-heat; the two main causes of this are overflowering and atmospheric starvation. The latter is bound to take place if, during hot and dry days, the ventilators are so freely used that more air is admitted than can be kept properly moistened. Last summer was so mild and moist that many Odontoglossums and Masdevallias would have taken but little injury if unprotected by glass. For all this I fail to perceive that these plants have done any better than after a very hot and dry summer. The foliage certainly looked more green than usual, but that is never a sure sign of permanent well-doing. On the other hand, Odontoglossums, after carrying plenty of flower, are none the worse if during the hot weather they look a trifle less robust than usual. If well rooted the colour quickly returns when the nights commence to lengthen. As of late I have been more than once asked if it were possible to

succeed with cool Orchids in any house not facing north, I may as well state that during the last ten years I have frequently seen them doing thoroughly well in houses facing north, east, west, and south, and that here we have no north house, but find the east answer in every respect. To pass these plants safely through six weeks of downright hot weather the grower must in the first place keep their roots undisturbed by potting; next, the atmosphere must be well charged with moisture by damping down three or four times a day, and by having the house rather heavily shaded. Finally, ventilate through the bottom ventilators during the day, but through the night use freely both bottom and top ventilators. Water must, of course, be given at the root often enough to keep the compost moist.

So soon as *Cypripedium Lowii*, *C. Stonei*, *C. levigatum*, *C. Pearcei*, *C. caudatum*, *C. Dayanum*, *C. Lawrenceanum*, and *Uropedium Lindenii* have recovered from the effects of flowering, let them be examined as to root-room. None of these care to be long in a pot-bound state, and the present is a good time to give them a shift. A mixture of peat, sphagnum, broken crocks, and charcoal will suit them all. The pots should be about one-third full of drainage. Give abundance of water at all times, and keep the plants well up to the roof glass on the shadiest side of the house. *C. Veitchii* or *superbiens* we find do very well in a similar position in the intermediate house, where, along with *Bolleas* and *Pescatorias*, it daily receives a thorough overhead watering. When grown in a strong heat this fine species is apt to suffer greatly from yellow thrips; it will at no time stand the least clear sunshine. Any plants of *C. Parishii* that are flowering freely will also be greatly refreshed if the foliage receives a good sprinkling once a day. Another Orchid which feels greatly the task of flowering is the splendid *Oncidium macranthum*. At all times a damp and cool loving plant, it should at this season of the year, when in flower, be even more frequently watered. Where the imported plants of *Grammatophyllum Ellisii* have gained sufficient strength they will be pushing flower-spikes from the base of the young growth. In order to assist the plant to develop its bloom and also to make up a strong growth at the same time, give frequent and liberal supplies of water and maintain a hot and moist atmosphere. The plant should be grown with the tips of its leaves almost touching the roof glass in the hottest division. Owing to the cold nights we are now having it is still necessary to use a considerable amount of fire-heat in the warm and hot divisions. The *Cattleya* and intermediate-house should be about 65°, and the East Indian-house 70°, through the night. *J. C. Spyers, Burford Lodge, Dorling.*

**TOWN GARDENING.**

**LAWNS, WALKS, AND SHRUBBERIES.**—Lawns should be kept regularly mown. If there is one thing that gives more trouble than another on lawns at this season of the year, it is the Daisies; the mowing machine will not take them off clean, and if left they make the place look very untidy, therefore the scythe or what was formerly used, the Daisy rake, has to follow after. Walks should be neatly edged, kept free from weeds and moss, and well rolled after heavy rains. Shrubberies should have the hoe run through them to keep down the weeds, and be frequently raked over to put on a bright and neat appearance. Spring planted shrubs should be especially observed, and be well watered in dry weather, and a coating of newly mown grass placed on the top of the roots.

**FLOWER GARDEN.**—I have not planted out any *Alternantheras* or *Coleus* yet (June 15), and I fear those that have, in or near town, will have to do the work over again. I was tempted a week ago to plant out *Mesembryanthemum cordifolium variegatum* and *Amaranthus melancholicus ruber*, and both of them will be some time before they get over the check they have received. The flowering beds must now have every attention, in order to assist the plants as much as possible. It matters not how poor the plants may be when planted out, or how well they are arranged, if they are not well looked after subsequently. Plants that will allow the hoe being worked amongst them to loosen up the soil, should have this attention as soon as the final planting is finished, and trailing plants should be regulated and pegged down to cover the space allotted to them, and all blanks that have occurred since planting was commenced must be filled up. *Cerastium tomentosum*, *Golden Feather*, *Golden Thyme*, *Golden Chickweed*, and such-like plants should be picked or clipped before they get too far advanced. Doing this early improves their appearance hereafter. Dahlias should be staked, and all subtropical plants should be supported before they get too large, for the wind is apt to break them down if not done in time. Climbing plants are now growing fast. *Clematis*, *Lepospermum*, *Maurandya*, *Tropeolum*, *Cobea*, *Eccremocarpus*, and all such-like plants on walls, trelliswork or fences, require to be nailed or tied before they get too far advanced. *Wm. Gibson, Chelsea, S.H.*

## APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, June 22	Grand Floral Exhibition at Portsmouth opens (four days). Royal Horticultural Society: Meeting of Fruit and Floral Committees, at 11 A.M.; Scientific Committee, at 4 P.M. Lee and Blackheath Horticultural Society's Show (two days).
WEDNESDAY, June 23	
	Leeds Flower Show (three days) Royal Jersey Horticultural Society's Show.

NO one will dispute the interest attaching to WEATHER RECORDS—no one will undervalue the statistics compiled with so much labour and accuracy by our official meteorologists and by private observers throughout the country. Nevertheless, for the practical purposes of the gardener, or the farmer, the hard dry facts revealed by thermometer and barometer are to some extent less valuable than observations made on growing plants. Rather should we say that the record of the meteorological observer needs to be co-related with the experience of the practical cultivator. A column of mercury, or spirit, may be extremely sensitive to atmospheric changes, but it is a simple substance compared with the complex and elaborate structure of a living plant. The record of the instruments may be compared to the analysis made by a chemist of a luscious fruit, or a delicious wine. Every element may be eliminated, and its quantity gauged, but the information so obtained is of little value to the merchant or the consumer. For him more concrete practical results are required. Thus it happens that observations on growing plants have, or might have, a greater value for practical purposes than mere records of the fluctuations of the barometer or thermometer, taken by themselves. We are obliged to say might have, because hitherto, with some exceptions, observations on plants and animals with reference to climatal variations—phenological observations as they are now called—have not been made with the accuracy and care with which they should have been. Owing to the complex and variable nature of the subject, a degree of accuracy even approaching to that of the tell-tale instruments is not to be expected, but at least such observations might be more useful and accurate than they are. An observer, we will say, jots down in his book—"Elms in leaf, Strawberries ripe, first Peas gathered," and so on. But of what use are such memoranda unless he observes the same Elm year after year, and tells us what he means by "in leaf," what variety of Strawberry he alludes to, what Peas he speaks of, and when and how he sowed them? All these little details seem to the amateur meteorologist of no particular moment, but the gardener will tell quite another story; and the record of his forcing-houses, properly kept, would to some extent furnish more trustworthy indications of the effect of climatal agencies on vegetation than do the ordinary meteorological records.

We have been led to these remarks from the perusal of a work, lately published under the title of the *Cobham Journals*.\* The nature and purpose of this work are sufficiently indicated by its title. It is gracefully and appropriately dedicated to the President and Fellows of the Meteorological Society by their first Lady Fellow. We cannot but regret that the original compiler of these extensive notes of observation could not, from the circumstances of the case, have been honoured with a similar recognition on the part of the meteorologists of the day. The reasons to the contrary could not well have been more valid, but, for all that, there can be no question that, had such an honour been practicable at the time, it would have been well bestowed on Miss MOLESWORTH. It is fortunate for her reputation, as well as for

\* The "*Cobham Journals*": Abstracts and Summaries of Meteorological and Phenological Observations, made by Miss CAROLINE MOLESWORTH, at Cobham, Surrey, in the years 1825 to 1850: with Introduction, Tables, &c., by ELEANOR A. ORMEROD, F.M.S. STANFORD.

meteorological science, that Miss MOLESWORTH'S voluminous manuscripts have fallen into the hands of so sympathetic and competent an editor. Not many persons, we suspect, would have been found at once willing enough, and intelligent enough, to wade through such a mass of detail, much of which must be unmanageable, and a great deal of relatively small value. Miss ORMEROD has not shrunk from the task, and she has given us within small compass abstracts and summaries representing for each month the general state of the weather, the dates of the appearance and departure of birds, the unfolding of flowers, the ripening of the fruit, and similar matters. Together with these summaries is given for each year a table showing the maximum and minimum temperatures, the rainfall and direction of the wind at Cobham, side by side with similar details taken from Mr. GLAISHER'S reduction of the Chiswick tables, and showing, not only the temperature and rainfall for each year, by way of comparison with those noted at Cobham, but also the averages from 1826 to 1869. A general summary of these several observations is given, and then a chapter, headed "Results of Observations," which are so interesting that we shall not venture to spoil them by fragmentary citation. We shall, if opportunity and space permit, transfer some portion of them to our pages, particularly as they have special interest in connection with the extraordinary seasons of 1879, of which we are this summer experiencing some of the effects.

The book ends with a table showing the date of flowering, early or late, of a great number of common plants during each one of sixteen years. Another column gives the mean date calculated from the foregoing data. The last column gives the "amplitude," or number of days between the earliest and the latest records of the first flowering of particular plants. These records are interesting as showing the great range of variation in these matters. For *Daphne Mezereum* an "amplitude" of 104 days is given, the earliest date being the 339th day of the year, *i.e.*, December 4; the latest the seventy-eighth (March 18)—a period of no less than 104 days, as the range within which the flowering of this shrub may be expected. If we take the mean between these two extremes the date of flowering would be on the fifty-second day (February 21), but the actual or observed mean of the observations gives the thirty-seventh day (February 6). The *Daphne* is a good plant to take as an illustration, from its shrubby habit and the probability that the same plant was examined each year. In the case of the *Cherry Laurel*, the earliest flowering is noted in 1834 on the twentieth day (January 20), the latest in 1827, on the 172d day of the year (June 20)—just six months' amplitude! We are not told whether the earliest or the latest observations referred to more than one shrub or more than one branch of a given shrub. From the facts cited we should infer that some exceptional or abnormal shoot may have been observed. The *Wistaria* is credited with an amplitude of twenty-seven days only (probably the plant was against a wall, and therefore less subject to violent changes), but the common Hawthorn, not likely to have been similarly protected, has an amplitude of twenty-two days. Elms show a range of forty days in the period in which their leaves have appeared, and twenty-one days in the period at which they are recorded to have been leafless. Valuable as these records are, they must, we imagine, be taken as indications only. So many disturbing causes—so many sources of error—so much partly unavoidable vagueness in the records—all suggest the necessity of treating them as approximations only; having, in fact, a considerable amplitude of their own.

— CANTUA DEPENDENS.—This lovely Peruvian shrub has lately been made the subject of comment in our pages, and although so lovely, is not so well

known to cultivators as its great merits demand, on which account we have deemed that a figure of it may not be unacceptable (see fig. 136). The specimens sent to us for illustration were grown by our correspondent, Mr. SHEPPARD, who lately detailed his method of cultivation (see p. 661). The *Cantua* belongs to the same family with the *Cobæas* and the *Phloxes*—*viz.*, the *Polemoniaceæ*, a comparatively small group, but one which, in proportion to its size, furnishes an unusually large number of ornamental plants.

— ALLIUMS.—Mr. BARR sends us specimens of two species—*A. Murrayanum*, with a stout scape supporting an umbel of pale bluish-pink flowers, the spreading segments equal in size, ovate-lanceolate; and *A. acuminatum*, with a slender scape, bearing an umbel of violet flowers, with three outer oblong-ovate shortly acuminate recurved spreading segments, and three inner erect much narrower segments.

— M. GUIHÉNEUF.—We are requested to state that this gentleman is no longer a member of the firm of ANDRÉ LEROY & Co., of Angers, but is established as a seed grower and seed merchant at Nantes.

— RUBEUS AUSTRALIS.—By an unfortunate oversight this name was attached to a very different plant in our last issue (p. 755). The plant intended was the old *Fragaria indica*, which was shown in the large tent at South Kensington last week, and which deserves the encomiums we passed on it. The true *Rubus australis* is a curiosity cherished by the lovers of oddities, and delighted in by the botanist. It is a true Bramble, but with the leaves reduced to a mere framework of prickly veins, with now and then a small leafy lobe at the extremity. We grew the plant for years out-of-doors, scrambling over a hedge, but sad to relate it was ruthlessly exterminated by an unappreciative gardener, who looked on it as a weed. The plant is a native of New Zealand, where, if we mistake not, others of its race display the same peculiarities.

— HARIOT CHEVRIER.—This variety, obtained by M. CHEVRIER, whose name it bears, is the subject of the following report from a committee of the French Horticultural Society, in 1878:—"We have made sure that *Haricot Chevrier* is really a new variety of the well known *Haricot Flageolet*; the leaves, pods and Beans keep perfectly green when well ripened. The Bean is small, of good form, and of a fine green colour; when cooked it remains perfectly green; and if left boiling for a long time it does not get pulped, and is of a very good flavour; however, it will be well not to let it be exposed to rain when ripe." A French correspondent, who sends the above, adds:—"When kept over the winter the Beans still remain green. It is an early Bean, and a good cropper; and will prove a very useful vegetable, especially in France, where Beans are preserved dry and eaten during winter."

— THE BEST METHOD OF PACKING FRUIT FOR MARKET.—We are requested to again direct the attention of gardeners and growers for market to the special prizes offered by Messrs. WEBBER & Co., of Covent Garden, for competition on the 29th inst., on the occasion of the Rose show to be held by the Royal Horticultural Society at South Kensington. The prizes are £7 7s. and £3 3s. for the best packed three boxes of fruit, to consist of one box of Grapes, not less than 14 lb.; and one box of Peaches, not less than twenty-four; one box of Strawberries, not less than 2 lb. To be booked, carriage paid, at any station over 20 miles from London, and delivered by railway company, addressed to the Superintendent, Royal Horticultural Society, South Kensington.

— ODONTOGLOSSUM VEXILLARIUM.—We understand that a magnificent variety of *Odontoglossum vexillarium*, named *floribundum*, is now in bloom at the York Nurseries. It has nine flowers on the spike, and produced twelve on one spike last year. Grand as it was last season, the magnitude of the flowers this season surpasses anything perhaps ever heard of, the individual blossoms being 5½ inches across, in extreme measurement. The colour is a soft, rich purplish-rose. Another, named *giganteum* last season, is also now in bloom. It has shorter spikes (seven flowers on the spikes), but

FIG. 136.—CANTUA DEPENDENS. (SEE P. 784.)

nearly equals the preceding in size, and almost surpasses in brightness of colour.

— **WILTS AND HANTS AGRICULTURAL COLLEGE.**—In our remarks last week as to the necessity of an extended education in the principles as well as the practice of agriculture and gardening, we had occasion to allude to the paucity of establishments in this country where such education could be obtained. We might have mentioned the newly established college at Downton, near Salisbury, which has been started with good prospects of success, and has a staff of teachers whose antecedents furnish a guarantee that the training they give will be thorough as well as practical.

— **FLORISTS AND LANDSCAPE GARDENERS IN AMERICA.**—The editor of the *American Gardeners' Monthly* remarks, in his last number, that there never was a better time in the history of his country for men of general intelligence, gentlemanly deportment, with a thorough knowledge of the finer branches of their business, and a small capital, so that they can afford to hold on a little while till their talents become known.

— **ENORMOUS RHUBARB.**—We had lately an opportunity of examining three large stalks of the Stott's Monarch Rhubarb, grown at Edenhall by Mr. WILLIAM ELLIOT, gardener there. The width of the largest leaf is 4 feet; length, 3 feet 8 inches; length of stalk, 24 inches; circumference, 9 inches. The weight of the largest leaf and stalk is 6½ lb., and of stalk alone 3¼ lb. The weight of the three stalks, without the leaves, is 9½ lb. It must be acknowledged that this Rhubarb is well grown. This variety of Rhubarb is attracting considerable attention at present among gardeners, even the Americans and Australians sending to this country for roots. *Kilso Chronicle*, June 11.

— **FORCING NEWLY PLANTED CHERRIES.**—As evidence of what can be done in the way of forcing newly-planted trees of this fruit, when they have been properly treated so as to prepare the roots for moving, and when, as in this case, the removal could be accomplished with the least possible breakage or injury to the roots, we instance some that were recently moved from an open wall to a house at Eastnor Castle. The house—a lean-to against an existing wall—was commenced last Christmas week, and the trees taken up and planted as soon as the frost broke. It is needless to say every root was preserved that could possibly be moved with them. The sorts were Bigarreau Napoleon, with a head 10 feet in diameter; an Elton, similar in size; and a Black Circassian, a little smaller. The house was, of course, started, and allowed to come on slowly. The trees have borne a nice crop, some of the fruit of the Elton reaching an inch in diameter, and the others proportionate in size.

— **THE SCORPION SENNA.**—This old-fashioned showy flowering shrub (*Coronilla Emerus*) is now in bloom. Its flowers present some peculiarities to which it is desirable to call the attention of those who have the opportunity of watching the ways of flower-visiting insects. All the petals have unusually long stalks, and the blade of the back petal, or standard, being nearly orbicular, there is left between its stalk and those of the four other petals a gap, or hole, into which one could thrust a crow-quill, and which is very conspicuous when the flower is looked at from the side. It seems probable that this arrangement may have some relation to insect visitations, but we have not been hitherto able to ascertain whether this is so or not.

— **ÆSTHETIC WILD GARDENING.**—The Board of Works has not been slow to take the hint we gave some time since with respect to the more general suitability of some kind of natural gardening around the new Natural History Museum at South Kensington, in preference to the stiff, formal arrangement laid out. Even the most enthusiastic adorer of wild gardening could desire nothing more wild, more natural, more inartistic, than is the display of natural plants now to be seen in the broad borders and huge beds of the Museum grounds. The common Dock makes a grand display. It is here the foliage plant *par excellence*. Its long tapering roots have penetrated deep into the rich freely-moved soil, and the leafage presents a degree of luxuriance rarely seen

even on the muck-heaps of the rural fields. Varying the somewhat overpowering wealth of Dock foliage is seen in considerable abundance the prickly Thistle, so precious to asses, but so annoying to the cultivators of the soil for its persistence. There is a charm and elegance about the finely cut leafage and bristling points of this plant that imparts to it, in contrast to the broad plain leaves of the Dock, an amount of beauty as a decorative plant which we claim to have been the first to discover. Bloom also is not wanting, but in colour lacking variety. Wild gardening in the country can be here and there diversified by the rich hues of the scarlet Poppy, glorious beyond the art of the painter to depict. Abundant masses of Charlock will for the nonce convert the fields into carpets and cloth of gold, and the Corn-bottle will give breadths of the loveliest blue; but here, in South Kensington, and right under the windows of the aristocratic Cromwell Roadians, only the common hueless Mayweed cares to bloom, but that in great abundance. If the authorities would but away with the turf and gravel walks, plant the Thorn and the Bramble, the Gorse and the Bracken, and turn down to roam at will Nature's fitting living denizens of woods, wilds, and hedgerows, then would London rejoice in a genuine natural garden indeed. We ought to add, that this site has for years past furnished the botanist with some of his choicest "finds," as not only native Docks there flourish, but waifs and strays from many a foreign shore, imported with foreign goods for the Exhibitions which have been held on the site, and constituting an "Exhibition Flora."

— **BANANAS, ETC., AT ASHRIDGE.**—In going through Lord BROWNLOW'S kitchen garden at Ashridge, by Berkhamstead (writes a correspondent), and seeing how successful Mr. SAGE is in the cultivation of the Banana, I was led to make a few inquiries, and obtained the following particulars, which may be of interest to your readers:—In January, 1879, through a break-down in the heating apparatus, Mr. SAGE replanted the house with suckers about 2 feet high, and has since then cut four large bunches of fruit, the last of which was hanging in the fruit-room, and weighed 90 lb.: eight of the fruit ready for table weighed just 4 lb., and there were 183 fruit on the bunch, which was 2 feet 9 inches from the top of the fruit to the point, and measured 4 feet 9 inches in circumference. It first showed through, September 9, 1879. There are three other bunches coming on: one showed March 25, one May 1, and the last one May 22, which promises to be a beauty. They are grown in a border at the back of a lean-to house 50 feet by 11 feet, with a glass front about 2 feet 6 inches high, which is made use of for Strawberries in pots, while *Passiflora edulis* fruits freely the whole length of the house. In the next house is a wonderfully fine crop of Figs. On the back wall of a house used for early Strawberries the pot Vines are very fine, with eleven to thirteen bunches of good size and quality. Vines for dinner-table decoration promise to be a great success; they are arranged on iron stands, alternately pyramid and table-shape, and average eight to twelve bunches. To see them is to admire them. Mr. SAGE has pots made expressly for the purpose of combining pot and stand in one, so that they cannot overbalance when placed on the table. Mr. SAGE has a plentiful crop of Apricots on the outside walls, thanks to the curtains which he uses every year.

— **THE POTATO CROP.**—Although the Potato tops are generally above ground, it is very obvious that cold nights and a remarkably dry spring have made the top growth very uneven, and there are far more vacant places in the rows than usual. It is now by no means unusual to note growth just pushing through, whilst adjoining are tops 12 inches high. It is long since we have had such a dry time from the planting period; and although rains have in some places fallen heavily and abundantly, there are other districts where the rainfall has been of the smallest, and the effects upon the soil merely temporary and transient. A heavy rain, sufficient to thoroughly saturate the soil for several inches deep ere the important work of earthing-up commences, would be of great value. On stiff lands the soil is still hard and impervious, defying the hoe, and rendering all attempts at good cultivation impossible. Where such is the case, the growth of the Potato seed is far more irregular than where the soil works freely, even though very dry. If the past few weeks indicate the

nature of the weather for the next two months, then we shall expect to hear but little of the disease. Perhaps nothing would do more to help stamp out the *Peronospora* in Europe than several successive hot dry summers, but such seasons would affect the Potato crop largely in bulk, if not in quality. In gardens where the early growths escaped the effects of the late frosts, and where a deeply worked rich soil offers the best of places for the production of large crops of Potatoes, the haulm is healthy, regular, and almost luxuriant. With a continuance of the comparative drought in such places there will be a healthy and early produce. If much moisture comes, then the usual disaster and decay will follow. We cannot plant for seasons until we can get forecasts of them that are reliable; but to none will such forecasts be of greater value than to cultivators of the Potato.

— **HERBACEOUS PLANTS AT KEW.**—Amongst the showiest of the herbaceous plants now in flower in the Kew collection are *Veronica Teucrium*, and some of its varieties, the following being the most desirable and distinct:—*V. Teucrium satoreifolium* grows about a foot high, and is extremely floriferous, being literally covered with compact upright racemes of splendid blue flowers; *V. latifolia* has broader leaves and paler flowers than the last, grows to about the same height, but seems rather a later bloomer. *V. alpestris* is a smaller plant with denser racemes, the colour being the dark blue of the first-named variety; and *V. rupestris* is a still smaller form, of similar colour and habit. *Nardostachys Jatamansi* is growing and flowering very freely in the Valerian bed; although not a strictly handsome plant, it is certainly pretty and worthy of a place in any garden. It is of considerable interest from the fact of its now being generally regarded as having constituted the Spikenard of the ancients; it is a native of the Himalayas, where two varieties exist—one a smaller grower and with redder flowers than the Kew plant, which has heads of rather large Valerian-like flowers, which are suffused with a pale purplish colour. *Lathyrus pisiformis*—a Siberian Bitter Vetch—is a handsome border plant with large showy flowers, deep red in bud, changing to blue when open, the wings being two or three shades lighter in colour than the standard. *Orobis canescens*, a beautiful old-fashioned perennial, about a foot high, has charming foliage and long-stalked racemes of large purplish-blue blossoms. On the rockwork *Saxifraga mutata* is very conspicuous; it has a dense rosette of hairy, spatulate leaves and a pyramidal panicle of orange-yellow flowers—decidedly ornamental and also curious by reason of their rather long narrow petals. *Gypsophila repens* is a very free-flowering plant, and its much-branched cymes of starchy white flowers, underlaid by the cushion of grey-green leaves and branches, are very charming. *Eschscholtzia tenuifolia* is a Californian annual of smaller size and more delicate habit than the common *E. californica*; the flowers, too, are smaller and of a pleasing soft lemon-yellow colour. *Echium rubrum* is a distinct and striking East European Bugloss, about 2 feet in height, with deep red flowers. One of the most attractive of the Labiates at the present moment is the Indian *Salvia hians*; it has long-stalked cordate acuminate leaves and very large blue flowers, the middle lobe of the lower lip being white, striped with purple: it grows from 12 to 18 inches high. *Dracocephalum speciosum*, another Himalayan Labiate, has whorls of purple-blue flowers; the root leaves are cordate, long-stalked, and the upper cauline ones are sessile—the Kew plant is about 1 foot in height. The East European *D. austriacum*, a neat-growing plant, about 18 inches high, has linear Rosemary-like foliage and spikes of large dark blue flowers.

— **EARL COWPER ON GARDENING.**—Replying to an address presented to him last week by the Royal Horticultural Society of Ireland, Earl COWPER said:—"For my part I must be content, as regards horticulture, to admire the glorious spectacle of a garden full of rich and varied colours, or to wonder in silent ignorance at the different developments of which the same plant is capable under different treatment. Do not think, however, I undervalue the science which it is your business to encourage. I am well aware that no occupation requires more natural ability, information acquired by great study—more labour of body, or more anxious or incessant application of the mind than that of the head gardener of a large establish-

ment. I am well aware of the humanising effect produced by the cultivation of flowers upon the roughest and most uneducated men. I am aware also of the intimate manner in which all sciences are connected together, and that the peculiar study which is necessary for success in horticulture has done, and may be expected to do, as much towards solving the great problems of the universe as any other. I therefore wish you every success, and shall always be willing to assist and encourage you to the best of my ability."

— **PHELIPÆA COCCINEA IN CULTIVATION.**—This handsome root parasite flowered last year in the Botanic Garden at Dresden for probably the first time under artificial conditions, and a representation of it is the subject of the thousandth plate of *REGEL'S Gartenflora*. The drawing, however, appears to have been made after the flower was past its best, and scarcely does justice to the plant. *Phelipæa coccinea*, or *Anoplantus coccineus*, is the most brilliantly coloured, or one of the most brilliantly coloured, members of the *Orobanchaceæ*, and in addition to the two names cited it has received at least half-a-dozen others. It is a stout brown scaly plant, 2 or 3 inches to a foot high, each stem bearing one large scarlet flower, nearly 2 inches in diameter. Sometimes, according to *BOISSIER*, the stems are two-flowered: but this must be of rare occurrence, for all the specimens in the Kew Herbarium are one-flowered. It inhabits the Caucasus region both to the east and west of the mountains, and has always attracted the attention of travellers. *KOTSCHY* says "Planta formosissima Quercetorum fruticeta incolit." Mountainous and alpine situations up to 6000 feet are its favourite haunts, though it also occurs in the neighbourhood of Erzeroum. We have seen it attached to *Achillea tanacetifolia* only, but it likewise preys upon various species of *Centaurea*. The plant which *M. POSCHARSKY*, Curator of the Dresden Botanic Garden, succeeded in flowering, was sent as a herbarium specimen from the Caucasus by *DR. KOCH* in 1876. *M. POSCHARSKY*, perceiving some signs of life in one of the specimens, planted it out-of-doors in a rock garden. The nurse plants were *Centaurea dealbata* and *Achillea tanacetifolia*, both of which grew, but the parasite itself did not appear until last June, when *M. POSCHARSKY* had nearly given up all hope. If the plant is a perennial, and it appears to be, it may prove a permanent acquisition to the Dresden garden, at least, just as *Lathraea* is in some of the *Rhododendron* beds at Kew. A noteworthy circumstance is the long time the parasite lay dormant. The seedlings of the perennial *Orobanches* are from one three years forming a root-stock sufficiently strong to produce flower-stems.

— **HORTICULTURAL PROGRESS IN AMERICA.**—We take the following from an essay read by *MR. PETER HENDERSON* before the New York Horticultural Society on March 9, and published in the current number of the *American Gardeners' Monthly*:

"It is estimated that there are 500 florist's establishments within a radius of 10 miles of the City Hall, New York, and that the capital invested in land, structures, and stock is not less than 8,000,000 dols., the product of which is mainly for New York City alone; and when we consider that New York contains only about one-fortieth part of the population of the United States, and that horticultural taste is certainly not higher here than the average of the country, it will be seen that the business of floriculture alone, without taking into consideration that of fruit and vegetables, is one of imposing dimensions. There is but little doubt that in nearly all the manual operations necessary in horticulture we are in advance of Europe, and no better evidence can be had in proof of this assertion than the fact that the cultivator gets one-third less for his products in the markets of New York or Philadelphia than the same products bring in London or Paris, though the price paid for labour is one-third higher here than there. Nor does it follow that the cultivator here works at less profit, for he does not; so that the only solution of the anomaly is that our necessities have compelled us to make such progress in our operations that our products are produced with less labour. For instance, when in London, in 1872, I saw twenty men in one squad, digging the ground in one of their market-gardens with spades. For the past thirty years there is not a market gardener on Long Island or New Jersey who would allow his ground to be dug with a spade, even if done for nothing, for he knows that the plough and harrow will pulverise the soil better; but *JOHN BULL*, in the neighbourhood of London at least, had not found that out in 1872, and it is no doubt the tenacious adherence to such primitive methods that is making

Europe in many of the industries of the day play second to the United States. Yet it must be admitted that in some phases of horticultural progress we are yet far behind Europe, particularly in the ornamentation of our public grounds. We have nothing to compare with the Battersea Park, London; the Jardin des Plantes, of Paris; or the Phoenix Park, Dublin; and when comparison is made of the grounds surrounding the villas in the suburbs of these European cities with our suburbs here, the comparison is, if possible, more against us, for there it is rare to see a neat cottage without a well-kept lawn, and good taste shown in the planting of its flower beds, its well trimmed fruit trees and neat vegetable grounds. Here, as yet, we have hundreds of expensive mansions, particularly in the suburbs of New York, where the so-called garden surroundings tell all too plainly of the Mushroom wealth of its shoddy owner."

— **ODONTOGLOSSUM VEXILLARIUM.**—We have received from *P. VATES*, Esq., Higher Feniscowle, Pleasington, some superb flowers of this beautiful Orchid. There are three well-marked varieties: one like the form called *superbum* with deep pink blossoms, which measure over 4½ inches across; another nearly white; and a third resembling that shown at the Regent's Park on Wednesday, by *MR. BULL*, as *picturatum*, but with more rose colour on the sepals and petals, the lip being margined with white, and having a rich crimson tridentate spot at the base, the side lobes of which are much shorter than the centre one.

— **ROYAL AGRICULTURAL BENEVOLENT INSTITUTION.**—The annual meeting of the Royal Agricultural Benevolent Institution was held on Wednesday week at Willis's Rooms, under the pre-idency of *MR. J. J. MEECH*. The report stated that the donations and subscriptions to the Society had increased during the past year, notwithstanding the protracted and deplorable vicissitudes that had borne so heavily upon the agriculturists. The Council acknowledged the munificence of many of the City Companies, and the assistance rendered by the rural clergy, who had in many cases handed over to the Institution the whole or part of the collections resulting from their harvest thanksgiving services. The total receipts for the year ending December 31, 1879, amounted to £15,125 19s. 11d., and the expenditure in respect of pension and school payments to £9782 15s. Seventy-three pensioners were elected; a considerable increase over the number previously elected. During the Society's twenty years' existence over £50,000 had been received in subscriptions and donations, and the Chairman hoped that that amount at no distant date would be doubled.

— **THE DALKEITH YOUNG MEN'S MUTUAL IMPROVEMENT SOCIETY.**—The young men employed in Dalkeith Gardens having established a society for mutual improvement some time ago, it has been carried on with much success and great benefit to the members, most of whom have contributed excellent papers to the meetings on a well-chosen variety of practical subjects. Meetings are held weekly from September to April, at which papers are read by members in their turn, and the various points discussed and explained for mutual advantage and instruction. During the session of 1879-80, twenty-six meetings have been held, at which thirty papers have been read and discussed; besides various other useful and instructive subjects which have been casually brought forward. The papers have all been of a practical nature, upon such useful topics as "Grape Growing," and the "Cultivation of the Heath," by *JOHN MCKINNON*; "Early Forcing of Flowers," "The Violet," and "The Onion and Leek," by *NIMROD SHERWOOD*; "Garden Walks," and "The Ice Well," by *JAMES DICKIE*; "The Cultivation of Ferns," and "Garden Manures," by *CHARLES WARWICK*; "Cultivation of the Peach," and "Planting Evergreens," by *CHARLES WEBSTER*; "Cultivation of the Banana," and "Forcing Strawberries," by *GEORGE SAGE*; "Ventilating Fruit and Plant Houses," and "Pruning," by *ALEXANDER WESTLAND*; "Culture of Asparagus," "The Potato" and "The Coxcomb," by *WILLIAM HARDY*; "Spring and Summer Bedding," by *WILLIAM KING*; "Culture of *Eucharis amazonica*" and "The Tomato," by *THOMAS LEE*; "The Cineraria," by *JAMES GRANT*; "The Fuchsia" and "The Gesnera," by *ROBERT DAVIDSON*; "Celery Culture," by *JAMES McDONALD*; "The Carrot" and "Cabbage Cultivation," by *LAURENCE HOUSTON*; and "French Beans and Scarlet Runners" and "Forcing Rhubarb and Seakale," by

*STAMFORD COSSAR*. The meetings have been punctually attended, and the subjects freely discussed in an instructive and intelligent manner. The business has been conducted in so harmonious a spirit that the session just closed has been highly successful. Occasional meetings are held during the summer, and the regular weekly meetings commence about the middle of September.

— **HARDY PLANTS.**—Among the finest of hardy flowers in the Cambridge Botanic Garden is a plant labelled *Lathyrus Sibthorpii*. It is a somewhat rare species, but much to be commended for earliness and the beautiful rose-purple colour of its flowers. Few of its genus are more lovely, and though not yet requiring support, it is in full bloom. *Erysimum pulchellum* has been one of the finest of plants on the rockwork. Its colour is of the brightest yellow, and commencing to flower many weeks ago, with a height of perhaps only 3 inches, it has now reached a foot with the production of its last blossoms. *Anthyllis montana* is still charming, and for many weeks it has been so, with such silvery leaves and delicate pink flowers. *Hippocrepis helvetica* is valuable for creeping over stones, clothing them with dense foliage and lighting up with numerous yellow flowers. *Lychnis Lagasce* is so well known as not to require putting forward, but the great beauty it has here will excuse a reference to it. The best plants are those grown from seed; they produce so much better flowers in size, and with greater profusion. *Narcissus poeticus*, fl.-pl., just going out of bloom, should be remembered for the value of its blossoms, which are almost equal—perhaps quite equal—to *Gardenia*. We have seen a beautiful wedding bouquet, of which its flowers constituted the greater part. *Hyacinthus amethystinus* and the white variety are extremely lovely and graceful. We have lately observed how valuable these and the *Scillas* are for lasting in water. *S. campanulata* and the white variety have bloomed in water from the opening of the earlier flowers till the forming of fruit nearly full-sized, and the fading of the last on the stem.

— **EALING, ACTON, AND HANWELL HORTICULTURAL SOCIETY.**—The summer exhibition of this Society will take place in the grounds of the Manor House, Ealing Green, on Wednesday, July 7.

— **THE WEATHER.**—General remarks on the weather during the week ending June 14, issued by the Meteorological Office, London:—The weather was rather cloudy in all parts of the kingdom, and at times very dull and showery. Thunderstorms were experienced at several stations during the first few days, and again in some places at the close of the period. The temperature was again below the mean in all districts. In "Scotland, E." the deficit was only 2°, but in all other parts of the country as much as 5° or 6°. The thermometer was highest in most places on the 12th or 13th, when 75° was reached at Nottingham and Cambridge; the lowest was on the 9th or 10th, when readings of 34° or 35° were registered over central England and Ireland. At some of the inland stations slight ground frosts occurred. The rainfall was a little more than the mean in "England, N.E.," "England, N.W.," and "Ireland, E.," and equal to the mean in "England, S.W.," but in all other districts the fall was slightly less than the average. Bright sunshine shows a decrease in Scotland, but an increase elsewhere. The sun was obscured most over the northern parts of England and east of Scotland, and least in Ireland and the south-west of England. The wind was generally south-westerly (except in the extreme north) during the first two days, very light and variable on the 10th and 11th, and southerly on the 12th and 13th, while on the 14th a northerly breeze sprang up in all parts of the country. In force the wind was generally light or moderate, but on the 12th and 13th the southerly breeze blew freshly or strongly on many parts of our western and northern coasts.

— **GARDENING APPOINTMENTS.**—*MR. JOHN WAKEFIELD*, late Gardener and Bailiff to *H. BARCLAY*, Esq., Middleton, has been appointed Gardener to *LORD DE CLIFFORD*, Hints Hall, Tamworth.—*MR. GEO. WYTHES*, late Foreman and propagator at Alexandra Park, Manchester, has been appointed Head Gardener to *H. W. FREEMAN*, Esq., Thirstaine Hall, Cheltenham.

AGAVE (LITTEA) VICTORIÆ-REGINÆ, T. MOORE.

ACAULESCENT; leaves 100 to 250 in a compact rosette, ovate-lanceolate, concave, 6—8 inches long, 2—2½ inches wide above the slightly dilated base, ¼ to (towards the base) 1 inch thick, rigid, dull green, with white markings, and a horny, entire, at last detached border, which terminates in a rigid, often twisted, blackish spine, usually bearing a few teeth at its base, often with a similar horny border on the dorsal keel, similarly terminating in one or two teeth at the base of the terminal spine (which thus appears two- or three-crested); scape, 8—10 feet high, 1 inch thick; flowering-spike about one-third of its length, very dense, bearing in the axil of each bract three short-pedicelled flowers; flowers about 2 inches long;

with and are probably produced by the pressure of the adjoining leaves, but other wavy, transverse marks on the leaves of younger plants can scarcely thus be accounted for. The inflorescence is that of a very dense-flowering Littea, the flowers with an extremely short perigonial tube. The great morphological interest consists in the regularly (at least in my specimen) tri-flowered bunches, the third flower occupying the centre between the two normal twin flowers of this section; this is probably the primary flower, which in most or in all other Littæas is entirely absent, or is in a few species only indicated and represented by a bristle. Where I have seen more than two flowers in a Littea (e.g., often in *A. utahensis*) the third and fourth flowers are axillary to the bracts of the first and second one. *G. Engelmann, St. Louis, U.S., May, 1880.*

should be clean washed, and soil chopped down small enough to work conveniently into the pots. A piece of fibry turf with the fine earth shaken out of it will answer for drainage in the small pots. Then fill them with the prepared compost consisting of loam and a dash of horse-droppings, and put a thin covering of sifted leaf-mould on the surface of the soil in each pot to peg the runner upon, in order that it may take root quickly at the joint, and stop growth beyond the latter by pinching. Plunge the pots between every alternate row of plants, so that they may be easily reached with water, and if it can be arranged to have plants for producing runners near to a good supply of water, where a boy with the assistance of a hose-pipe can attend to their daily requirements in dry weather, it will be something saved in labour. Varieties.—A selection of suitable varieties is one of the most important points bearing upon success in Strawberry forcing. Identical varieties behave so differently under different

FIG. 137.—AGAVE VICTORIÆ-REGINÆ.

ovary over ½ inch; tube broadly funnel-shaped, only ½ line long, perigonial lobes oblong-linear, 8 lines long; filaments inserted at the base of the lobes, more than twice as long as these, and rather exceeding the style, which bears three orbicular, at last spreading, stigmas; capsule about 9 lines long, oblong, cuspidate; seeds, 2 lines long.—*Gard. Chron. n.s., iv., p. 485, with woodcut (fig. 137); Flore des Serres, xxi., p. 169, with woodcut, Baker, in Gard. Chron., vii., p. 528.—A. Consideranti, Carrière, in Rev. Hort. 1875, p. 429, fig. 68.*

In coarse gravelly soil on steep hills near Monterey, Northern Mexico, flowering in autumn according to Dr. E. Palmer, who gathered fruiting specimens in February last. The largest plant which he sent to St. Louis has a diameter of 2 feet, a height of 14 inches, and bears about 250 leaves, 7 to 8 inches long and 2 to 2½ wide. The leaves of the older plants bear white streaks, which seem to correspond

### Home Correspondence.

**Preparations for Strawberry Potting.**—We are now upon the advent of a new year in Strawberry forcing. No interval of rest for the weary gardener between gathering the last crops from the present season's plants and the preliminary preparations that weather and other circumstances press upon our notice as being indispensable in laying a good foundation for another year. Runners are both early and abundant upon young plants which were planted out of small pots last August, while there is not a score of runners upon forced plants which were planted upon trial early last April. We have, therefore, favourable prospects before us. Layering Strawberry runners is an uninviting piece of business, unless the workman has an interest in his work. It is best, therefore, to select nimble fingers as well as willing ones to execute the work if it is to proceed quickly and satisfactorily. All materials should be got in readiness beforehand, pots (large or small 60's)

conditions of soil and climate, that it requires the experience of a season or two to enable one to eliminate from the list such kinds as are not free croppers, or that inherit constitutional infirmities which appear to develop in some instances and to disappear altogether in others under circumstances already indicated. For the North of England half a dozen good kinds would be Vicomtesse Hélicart de Thury, La Grosse Sucrée, Underhill's Sir Harry, President, Sir Charles Napier, and either Dr. Hogg or James Veitch, the former being the best cropper and the latter carrying off the palm in point of size. Six sorts for the South of England would be Keens' Seedling, Vicomtesse H. de Thury, Underhill's Sir Harry, President, Sir C. Napier, and Dr. Hogg. The best all-round Strawberry for forcing in this climate after the month of March is undoubtedly President, and for late crops Sir Charles Napier is one of the first in cultivation, but although a free cropper it wants skill to give it that brilliant gloss which is indicative of superior management. Hence we often

find the variety spoken of as a coarse sort by persons who do not or cannot observe individuality in different kinds of fruit. This latter variety should always be grown where fruit has to be sent a long distance by rail, it travels better than any other kind that I could mention. Soil for Potting.—Where loam has been stacked up in narrow ridges for some time the scorching winds of the past three months will have sucked every particle of moisture out of it. Last year being so wet it was found difficult to keep large bodies of soil in a working state, and this year having made our heaps less it is found to be too dry. It will, therefore, be advisable where this state exists to take the ridges of soil to pieces, and reconstruct the flakes in the shape of a square with a flat top, and to drench the whole thoroughly with water, repeating the application once or twice with some safe sewage liquid. When the soil is found to be sufficiently moist it should be chopped up to suitable size, adding about one-third of horse-droppings, bone meal, and wood ashes, to the whole compost, and after thoroughly incorporating the different parts together it should be placed in some sheltered niche and covered over with old mats or bags until it is required for use, when it will be found an advantage to have so much of the work accomplished beforehand. As soon as the young plants are found to have filled the small pots they may be severed from the parent plants, and if the weather is dry let them be set behind a north wall until they recover themselves from the effects of separation; on the other hand, in case of wet weather, they must have the protection of a glass covering, to keep them in proper condition for potting at any time. When runners are early, as is the case this year, there should be no hurry to get through the last potting, rather humour the plants so as not to starve them in the little pots, and give the final shift no earlier than the second week in July. A good many growers use large pots for Strawberries, in which case potting should be done in time to give the plants an opportunity of filling the pots with roots, and of making and ripening a crown (or crowns if the cultivator chooses) in proportion to the size of the pot. The last fortnight in July would be a good medium time for doing the bulk of the potting. I may, perhaps, observe here that we often go to the extreme of what is called in horticultural parlance ramming. The soil should certainly be made firm in the pots, but not pounded, as it often is, and there should be fully an inch of space left for the double purpose of top-dressing, with rough horse-droppings, the surface of the soil in each pot, and for giving abundant supplies of water to the roots of the plants. The refuse of an old Mushroom bed is capital material for top-dressing; it is a good retainer of moisture, owing to its spongy nature, and promotes vigorous root-action where it is most important to have roots in the greatest number. *W. Hills.*

**Edgings to Garden Walks.**—There can, I think, be no question, that as a live edging to garden walks, Box forms the neatest and best looking, and is therefore in more frequent use than any other, but the great objection to it is that it harbours slugs, which find in it a secure hiding-place from whence they sally forth for their nightly depredations, and return again before sunrise gorged to repletion with the tender morsels of succulent seedling plants gleaned in their foraging expeditions. To break up the homes of these pests is a great gain, as when they have no retreat beyond the chance ones a clod or leaf affords, they are more at the mercy of birds whose preying eyes are ever on the alert, as may be seen in the diligent way they search such places after a shower, their instinct teaching them where to look to find food for themselves and young ones. A striking instance of this is before me now in front of the window I am writing at, where a thrush is busy at work turning over the *débris* among the grass, and having just secured the prize she or he was in search of, is now on the wing, and no doubt off to the nest to drop what is found in the gaping maw of one of the brood. Besides being diminished in this way, slugs in gardens when they have no dense wall-like mass of green edgings of Box to ensconce themselves in, are always abroad where they get disturbed by hoe or spade used in cultivating or stirring the land, when numbers are destroyed, and myriads of eggs, that, were they deposited anywhere else in a position like that mentioned, would escape and hatch, to crawl about and be a plague for months after. In addition to the slug nuisance, another disadvantage in having walks margined with Box is that they cannot be silted without running much risk of injury to the edging, which is a great drawback, as where there is much gravel surface the labour of hand weeding is something enormous and forms a serious item in garden expenses; besides which the walks, when the weeds have to be eradicated in that way, are always more or less loose through being broken up and disturbed, but if salted, not only will they be thoroughly cleansed from all mossy growth and con-ferva that accumulates during the winter, but they will also be considerably improved in solidity and

brightness, the salt having a hardening and binding effect if the walks are rolled after wet weather. If dead edgings are used, salt can be applied at any time. The best manufactured article I have seen for the purpose is some cable-patterned tiles that Mr. Roberts was having put down at Baron Rothschild's at Gunnersbury, which tiles are made of Staffordshire clay, and burned to such a degree as to be almost as hard as iron. This hardness is a great point in their favour, as they do not chip or get broken and disfigured in the way others do, and as they have holes in the ends in which to insert short pieces of stout wire rod, they are by that means held together so rigidly as to always remain straight and immovable. The only objection to them is their colour, which is nearly black, but by running a brush over them a few times with some Portland cement, the improvement would be such, I think, as to leave little to be desired. Where formal edgings of this kind are not considered the right thing, more natural-looking ones may be formed with large pebbles or flints, and if the spaces between these are filled in with *Gentiana acaulis* or *Thrift*, the effect in spring will be most beautiful, especially if the former plant is used, as, being quite at home with its roots under the cool stones, it will flower with great freedom, and nearly cover them up with its neat little foliage. The leaves being small afford little harbour for slugs, and the *Gentian* may therefore be grown in any garden; but as it is fond of rather stiff soil, it is advisable before planting to work in some clay, which, buried, is very retentive of moisture. Managed in this way the plants keep healthy and strong, whereas in light land without this aid they suffer much in summer, but *Thrift* will keep alive and do almost anywhere. *7. S.*

**Scale on Plum Trees.**—I should strongly recommend "Perth" to let the next trial be with the fluid sold by Messrs. Killengrey & Jacques, Doncaster, as "Soluble Phenyle." I have not tried it myself for this purpose, but a neighbouring nurseryman informs me that he has found it answer perfectly in clearing scale from a more tender-barked tree than the Plum. The fluid should be used very dilute till your correspondent finds what strength is safe, but I think he might begin with three tablespoonfuls in a gallon of water to all the harder bark. It should be brushed in (an old tooth-brush is a good instrument) or rubbed in with a flannel; this takes off quantities of the scale, and the eggs, and the smell makes the rubbed bough very uninviting for insect deposit. It is necessary, however, to be careful, for if the fluid is allowed to drip about, it will kill the bit of the leaf that it lies on; a very little care, however, makes all safe. If your correspondent thinks fit, I would, with pleasure, on receipt of his address, forward him a small quantity for experiment, as I am anxious to gain any information of remedies found practically useful in counteracting insect injuries, and have not had opportunity of experimenting myself on this special form of attack. *O.*

**The Herb Sorrel.**—Referring to the notice on the "Herb Sorrel," at p. 757 of your issue of the 12th inst., "H. M. E." will find an account of Sorrel in John Evelyn's *Acetaria*, p. 138, art. 69. "Sorrel. *Acetosa* or *Oxalis*, of which there are divers kinds. The broad German *Acetosa maxima Germanica*: The Roman or French *Acetocella* with the Round Leaf, *Oxalis Franca* or *Romana* with the repeat Rounder Leaf found by that accomplish'd Botanist the late Mr. Ray growing in Cumberland (as likewise in Wales). The barren Sorrel of Russia deservedly esteem'd by many: But after all the best is that of *Greenland*. Sorrel is by nature cold, abstersive, acid, sharpening the appetite—asswages Heat, cools the Liver, strengthens the Heart: is an *Antiscorbutic*, resisting Putrefaction and imparting so grateful a quickness to the rest, as supplies the want of *Orange*, *Limon*, and other *Omphacia*: and therefore never to be excluded. *Vide Wood Sorrel.*" On turning to this, I find at p. 141, art. 82, "Wood Sorrel. *Trifolium Acetosum* or *Alcheja*, of the nature of other Sorrels." This extract is copied verbatim, the capitals as used by Evelyn, and the words in italics as in the original. *7. A. C., June 13.*

— In reading "Notes from a Lancashire Garden" in your paper of June 5, I was surprised to find the writer wonder at any one making use of our common field Sorrel. It is very often used with boiled knuckle of veal, made just as you would make mint sauce. I have partaken of it in Yorkshire and Lancashire. *W. B., Eccles, June 10.*

— A good deal of Sorrel is used in all large houses where French cooks are employed. It is also extensively eaten, even by children, in the North, or used to be, either with bread-and-butter, or alone. In France it forms a frequent and very pleasing addition to salads, and is cooked and used in a somewhat similar way to Spinach, as well as employed as a sauce and in several made dishes of tit-bits, as referred to by "H." It is used in salads in England, while the tender leaves in the spring are a mild and pleasant acid with

bread-and-butter. Sorrel is supposed to be cooling for the blood as well as tempting to the appetite, either eaten alone or mixed with Watercress or Mustard-and-Cress. The heat of these two may be nicely toned down by the addition of Sorrel to please the palate of those who think the Mustard-and-Cress too hot. *D. T. Fish.*

**Hardiness of Azalea Mrs. Carmichael.**—Last autumn I planted out two plants of Mrs. Carmichael Azalea; I am happy to say they have withstood the winter, and are at present looking as lively as possible. The winter of 1879 and 1880 was as severe as nearly any on record. I don't know how many degrees of frost were prevalent in the good days of old, probably the severity of the frosts has degenerated with the same declension as everything else (?). The plants were put out in an exposed situation, and had no protection. I am fully confident that hybrids between Mrs. Carmichael Azalea and the large flowered greenhouse varieties will be hardy. Then let Rhododendrons look to their honours. A gentleman in America who had noticed a paragraph of Mr. Fish's ancient hardy Indian Azaleas lately made a few favourable comments in the *Gardeners' Chronicle*. I hope if he sees this he will attempt to rear a large-flowered hardy Indian Azalea without the aid of *Azalea mollis*. *William Carmichael, Newton Court, Bury St. Edmunds.*

**Broccoli.**—As the Broccoli season is fast drawing to a close, the present is a good time for deciding which is the best to grow. The two last winters have tried the Broccoli severely in this part of South Yorkshire. I grow chiefly Cattell's Eclipse, Carter's Champion, and Richmond Late White. Cattell's Eclipse is a well known good variety, but the two last winters here have proved too much both for it and Carter's Champion. Not more than five per cent. have stood, whilst Richmond Late has not suffered to the rate of 10 per cent. I have been cutting from it for about a month, and to all appearance it will last another fortnight; those who have not tried it should do so, and I don't think that they will regret it, as for hardiness and quality there is nothing to equal it in this part. *T. H.*

**Abies Nordmanniana.**—Has anybody noticed this peculiarity in the growth of *Abies Nordmanniana*? In an avenue of this tree, leading to my house, each specimen has burst into growth and made shoots between 4 and 5 inches, on the south-west side, while on the north-east side the buds are only just pushing—not yet burst. Has this been observed elsewhere, or in other trees? *A Novice.* [Not uncommon. *Ebs.*]

**Lamium longiflorum.**—A plant bought under this name in early spring in a 3-inch pot is now in full flower, and covers more than a square yard of ground on one of my rockeries. It is a showy plant, having large flowers, and its flowering shoots well raised, but its greediness for room detracts from its virtues: its habit is coarse and straggling, and the colour of its flowers, light purple, is not very attractive. In general appearance it is less ornamental than the old *Lamium maculatum*, the yellow variety of which is a most useful plant to fill gaps on a rockery, as I find it endures any amount of transplanting, and cutting into shape. *C. Wolley Dod, Edge Hall, Malpas.*

**Asparagus plumosus.**—I am pleased to see that this fine decorative plant is being brought into notice. I have known it for the last five years. I am working up a large stock of it for table and cut flower decoration. I have been using it for the last two years for all kinds of floral ornamentation. Plants of it, well grown in 5-inch pots, for dinner-table adornment, cause quite a sensation, while nothing can equal it as a green for ladies' head-dress, as it produces so many beautiful shades of green. *Richard Nisbet, Aswarby Park Gardens, June 12.*

**Notes made at Kew.**—Having spent an hour lately in the herbaceous garden at Kew, may I be allowed to mention a few plants with which I was most impressed? On the central rock beds the most striking Saxifrage seemed to be *S. valdensis*, in habit something between *S. pyramidalis* and *Aizoon*, and of very neat growth. *Geaista sagittalis* and *Orobancha canescens* were very ornamental amongst the stones on the next raised bed, where, I should have discovered, if I had not known it long ago, that the common British Trefoil, *Lotus corniculatus*, is one of the best of rockery plants. The bed of *Thalictrum* always looks well at Kew, though this year they are a little dwarfed by the drought in spring; this suits some of the stronger growers, like *T. flavum* and *T. aquilegifolium*. If I were judge, *T. tuberosum* would win the first prize. The next bed, assigned to *Aquilegia*, is always disappointing at Kew. Dry hungry soil is not suited to *Columbines*. On my strong and cold soil I could find single plants of *A. fragrans* or *A. canadensis*, to

say nothing of *A. vulgaris*, which could swallow every Columbine in the Kew bed without much inconvenience. I dare not criticise the names, but two-thirds of the bed seemed to be made up of very ordinary varieties of *A. vulgaris*. A charming little cruciferous annual, *Ionopsidium acaule*, making close cushions covered with white flowers, would probably sow itself and share vacant spots on the rockery with *Saxifraga cymbalaria*, and injure nothing. Amongst the *Erigerons*, *E. glabellus* and *E. pulchellus* are conspicuous by their large flowers combined with dwarf habit. Amongst larger showy border plants, not yet common in nursery catalogues, I noted *Lindolepis spectabilis*, *Cirsium heterophyllum*, *Khaptonticum pulchrum*, *Chrysogonum virginianum*, and *Platystemon californicum*. I should recommend a compact dwarf *Eriothera*, with white flowers as large as those of *E. macrocarpa*, named *E. marginata*, were it not that I find no white flowered *Eriothera* hardy. *C. Wolley Dod*, *Edge Hall, Malpas*.

**Lilium giganteum.**—This Lily has in a cool house here attained the height of 7 feet 6 inches, and has produced six well developed blooms from 6 to 6½ inches long, and nearly the same width across. The foliage, which is extremely perfect, is well set on the thick stem at intervals varying from 5 to 8 inches. The bulb is an offshoot of one I bloomed three years ago, and has been shifted when necessary until it now stands in a 10-inch pot. *C. W., Brighton*.

**Early Peas.**—The first show of English grown green Peas in our market in anything like quantity this season was on Wednesday, June 2, three weeks earlier than last year. The Improved Sangsters have fine pods; the plant being thin, they are larger and have more in them than last year. William I. does not seem to be so prolific as the Improved Sangsters. Some of the Pricetakers will be ready about the end of next week, the warm rains lately have helped them on considerably. Asparagus comes very thin and spare here this season: is this general? I suppose from lack of sunshine last summer the stalks did not ripen and wither early enough for the crowns to mature and set strong shoots. Strawberries look well, and promise an abundance of fruit; the Potato plant is strong, good in colour, and growing fast. All we want is bright summer sunshine and warmer nights. *H. Alexander, Totterdown, Bristol, June 8*.

**Messrs. Paul's Protest.**—Permit us to reply to "One of the Judges" in your last week's impression: we will do so as briefly as possible. We were quite right in protesting against a wrong judgment; of course the judges do not agree with us in doing this, but no other resource is open to us, as there is no appeal against their decision. His letter quite confirms our opinion, that the decision was arrived at rather by a consideration of the awards of the past three years than upon the merits of the plants. The supposed invincibility of our opponent was seemingly overpowering. "One of the Judges" seems to have forgotten that if the balance of awards for these big specimens had been against us the last three years, the previous two years the majority of the first prizes were ours, as at Oxford v. Cambridge fortune sometimes varies. We hold we fairly turned the tables on Saturday week, and we adhere to our opinion. There was no slur on the judges—we did not when writing the protest know who they were. We would suggest to flower show authorities, however, where pot Roses are amongst the classes, a good grower and exhibitor, past or present, of pot Roses should be "one of the judges." *Paul & Son*. [It does not always follow that "a good grower and exhibitor" makes a good judge. We should think most "showmen" could evidence to the contrary. *EDS.*]

**Stephanotis floribunda.**—This much esteemed and highly scented flowering hothouse climber has, I think, done well in most places this season, but nowhere have I seen it grown better than in a small span-roofed house in the Earl of Sydney's gardens at Frognaul, Chislehurst, where I noticed a few days ago two splendidly flowered plants, which covered the south front of the house with their rich green foliage and pearly-white flowers, which were produced in great profusion from the axils of every leaf of the young growths, thus producing a continuous supply of these "never too plentiful flowers." These plants were growing in good-sized pots, and were standing on a slated stage, one at each end of the house, within a few inches of the flue—for it is an old-fashioned house—which is covered with a couple of inches of suitable soil, into which the roots have freely pushed, with unmistakable signs of having materially benefited the plants thereby, as was amply demonstrated by the display which I had the pleasure of seeing on the 9th inst. From these two plants Mr. Marsh, Lord Sydney's persevering gardener, informed me that he had been cutting freely for the last few months, and, judging from the evidence then adduced, he is likely to continue to do so for some considerable time to come. Perhaps whilst sounding the praises of the above

favourite plant I may be allowed to say a word or two in favour of its compeer, the *Gardenia*, which was flourishing equally well in a hot-water pit adjoining the house above referred to, and in which was to be seen a fine example of *Gardenia* culture. The plants, which were planted out, were in a vigorous and perfectly clean and healthy state, not an insect of any kind being visible on them, and were, as they have been for some considerable time past, producing fine large flowers very freely. I may also state, in conclusion, that in front of Mr. Marsh's cottage, in a house (in two compartments) recently erected and heated by Messrs. Weeks & Co., of Chelsea, is a fine collection of new *Coleus*, *Palms*, and other decorative plants of that useful size usually employed for dinner-table decoration. Mr. Marsh has a considerable amount of labour throughout the year in this department of embellishment, if it can be called by that name, as useless as it is out of place, and one in which there are more flowers ruthlessly destroyed than in the embellishment of the boudoir and drawing-room combined. *H. W. Ward*.

**Select Hardy Perennials, &c.**—The following select hardy perennials were in flower at Southwood, Bickley, on June 12:—

*Anchusa incarnata*  
*Astragalus monspessulanus*  
 " *Hypoglottis*  
*Armeria maritima alba*  
 " *rosea*  
 " *uncea*  
 " *purpurea*  
*Aquilegia Whittmanniana*  
 " *glandulosa*  
 " *grata*  
 " *Burgeriana*  
 " *cerulea*  
 " *hybrida*  
 " *chrysantha*  
*Asphodelus liliacinus*  
*Anthemium Liliaceum major*  
*Allium azureum*  
 " *cernuum*  
 " *narcissiflorum*  
*Allium Moly*  
*Achillea aurea*  
 " *subumbellata*  
*Arenaria loricifolia*  
 " *verna*  
 " *caespitosa*  
 " *norvegica*  
*Æthionema cordifolium*  
*Anemone sulphurea*  
*Ajuga alpina*  
*Aubrieta Columnæ*  
 " *Campbellæ*  
 " *græca*  
 " *croatica*  
*Anthyllis montana*  
*Alyssum spinosum*  
*Astragalus carnioleica*  
*Aster ramosus*  
*Bahia lanata*  
*Borago laxiflora*  
*Campanula carpatica*  
 " *collina*  
 " *marialis*  
 " *isophylla*  
 " *agregata*  
 " *glomerata*  
 " *ahurica*  
 " *Wanneri*  
 " *pulla*  
*Coronilla iberica*  
*Cyclobotria pulchella*  
*Claytonia sibirica*  
*Cerasium Biebersteini*  
*Cynoglossum apenninum*  
*Crucianella stylosa*  
*Cypripedium spectabile*  
*Chryso-bactron Hookeri*  
*Centaurea montana*  
 " *stricta*  
*Caltha leptosella*  
*Delphinium cashmirianum*  
 " *Barlowi*  
 " *nudicaule*  
*Draba brunifolia*  
*Dielytra eximia*  
*Dianthus corsicus*  
 " *mariscus*  
 " *sylvestris*  
 " *caesius*  
 " *neglectus*  
 " *typhrestus*  
 " *petreus*  
 " *fimbriatus*  
 " *fragrans*  
 " *floribundus*  
 " *plumarius annulatus*  
 " *atrorubens*  
 " *deltoideus glaucus*  
 " *navis*  
*Erinus hirsutus*  
 " *albus*  
 " *hispanicus*  
 " *alpinus*  
*Erigeron regalis*  
 " *uniflorus*  
 " *grandiflorus*  
 " *alpinus*  
*Erodium petreum*  
*T. D. H.*

**Double Fungi.**—In the *Gardeners' Chronicle* for 1873, p. 218, I called attention to an enormous crop of double specimens of *Agaricus cristatus* growing in one of the houses at Gunnersbury. Every specimen in this instance had two caps, one inverted on the top of the other. I had almost forgotten the circumstance, but am reminded of it to-day by seeing a crop of *Agaricus papilionaceus* growing on some grass in front of my house—every individual plant of the crop

being double. This new company of double specimens seems to indicate that the duplication must be inherent in the spawn. Now as double Mushrooms are by no means uncommon in Mushroom-houses, it seems possible (as I suggested in 1873) that a race of double Mushrooms might easily be secured, by isolating the spawn belonging to the double specimens. A race of Mushrooms of this class would be a valuable one, as each cap would be in duplicate, and the cap of the mushroom is really the only part esteemed for the table. *W. G. S.*

**Araucaria imbricata.**—I have this year an *Araucaria imbricata* about 15 feet high, with about seventy cones on it. Do you know if this is a general thing this season? I have much larger trees than the one with the cones, but never had a cone on them. *W. Fletcher, Ottershaw, Chertsey*.

**Boilers.**—The case of "Eromegnar" seems to present no very great difficulty. If boilers of sufficient strength be used, the fact of the houses being above the site intended for the boilers will be an advantage, as the circulation of the water will be very rapid; and the necessity for stokeholes, with their risk of flooding, will, if I read his question correctly, be quite obviated, while, if plenty of non-conducting material be packed round the piping between the boilers and the houses the loss of heat will be slight. *George Druffield, Winchmore Hill*.

**Rumex sanguineus as a Rock Plant.**—Probably one of the most beautiful and distinct species of the order Polygonaceæ is *Rumex sanguineus*, and for foliage, as a rock plant, is surpassed by few. The stems and veins are of a blood-red colour, thus giving it a decidedly peculiar and interesting appearance. When planted in a garden it grows very much larger than when growing wild; I had one growing in my garden, the leaves of which grew over 1 foot long. Around Penzance it is nearly as common as the *R. viridis*. Are such beautiful plants excluded from our gardens and cast away, simply because they happen to be natives of our hedgerows, &c.? It seems so. *W. Roberts, 9, Chapel Street, Penzance*.

**The Cuckoo.**—The lines quoted at p. 758 are directly illustrated by the charming song at the conclusion of Shakespeare's "Love's Labour's Lost." The "slanderous" quality of the cuckoo's note is in part the product of a pun, and in part perhaps of its habit of conveying its young into a nest it has no legal right to. A *cucoul* in old French is a cuckold, and our word cuckoo has been modified by time and usage from *cucoul*, having the same meaning, a remoter root being the Latin *cuculus*. *S. H.*

**The Winter and the Plants.**—The following are some of the plants that have escaped the past winter around Penzance out-of-doors:—

*Embothrium coccineum*, un-  
 hurt  
*Abutilon Boule de Neige*,  
 ditto, protected  
*Aster argophyllus*, slightly  
 nipped  
*Dicksonia antarctica*, unhurt,  
 but protected  
*Eulalia japonica zebrina*, un-  
 hurt  
*Phoridium tenax Veitchii*, un-  
 hurt  
*Iberis gibraltaria*, ditto  
*Fabiana imbricata*, ditto  
*Seaforthia elegans*, nearly  
 killed

*Hedychium flavum*, coming on  
 very slowly, and no doubt  
 slightly injured  
*Lycycteria formosa*, unhurt  
*Aralia papyrifera*, slightly hurt  
 nipped  
 " *heterophylla*, unhurt  
*Colletia horrida*, ditto  
*Desfontainia spinosa*, ditto  
*Nandina domestica*, ditto  
*Eucalyptus globulus*, ditto  
*Lilium giganteum*, ditto (7  
 feet)  
*Maurandya Barclayana*, un-  
 hurt, and now in flower  
*Garrya elliptica*, unhurt  
*Dracena australis*, unhurt

*W. Roberts, 9, Chapel Street, Penzance*.

**Great Scarcity of Hawthorn Flowers in Cornwall.**—Notwithstanding the very severe winter of 1878-79, the Hawthorn trees were laden with blooms last spring long ere this, but this year scarcely six bunches of bloom can be seen on one tree. Whether the overflowering last spring, the wet and gloomy summer, and the rather severe winter that followed, had anything to do with it I cannot tell, but I cannot account for it in any other way. Should next winter prove as severe as the two past our birds will have very hard times of it. *W. Roberts, 9, Chapel Street, Penzance*.

**Stopping Laterals on Grape Vines (p. 691).**—It appears to me from the evidence before me, as contained in the paragraph referred to, that Mr. Earley bases his arguments upon a somewhat vague assumption. Mr. Earley argues that as the activity of leaves and buds of the Vine is developed before that in the roots, which are formed in consequence of the latter, the practice of suppressing the young leaves is of doubtful utility. Now I think it can be clearly and satisfactorily proved that there need be no doubt whatever as to the advantage of stopping the growth of the Vine within certain defined rules under our artificial system of cultivation. To keep within bounds I propose to take a simple case as an illustration. When a Vine is planted it is of course grown on the long-rod principle the first year, and those who are fond of

catching at straws may say that as long as you extend the leader the first two or three years it is a mixture of both systems. I will not dispute the point, but leave it to some of those hair-splitting gentlemen who are expert at defining niceties to determine the question. There is a principle involved, and I want first to establish a certain fact in a simple way, and then to base the few remarks I have to make upon the existence of that fact. If we plant two Vines, say the present year, and allow them to grow as they will this season, and prune them back in the autumn to within a foot or so of the base, and take two rods away from one Vine next year and only one from the other, what will be the result? Simply this: there will be one extra strong canes in the latter case, and two of less vigorous growth in the former. If those Vines are fruited the following year, say at the rate of four bunches to each rod, the single rod will finish off its four bunches of fine berries as black as Sloes, while the two canes bearing eight bunches, perhaps quite as large in bunch but not in berry, will be sadly deficient in colour. This is the result of over-cropping, if in both cases the canes are composed of matter of equal quality; and it points conclusively to a fact which gardeners would do well to give more attention to than they do. There is manifestly a striking difference in the quality of fruit produced by a Vine which is cropped to extreme tension point and one that is moderately cropped; is it, then, too much to affirm that the Vine that is being drained of its resources by a useless crop of laterals is in any better position than the one that is being over-cropped? It is merely two ways of accomplishing the same end. The laterals are to a cultivated Vine what an overflow-pipe is to a cistern; they waste a good deal of the vigour of the Vine, but it would be a rash assertion to state that the Vine is none the worse for it. The statement is, however, made upon the assumption, that as the activity of leaves and buds of the Vine is developed before that in the roots, the advantage of stopping is of doubtful utility. But it must not be forgotten that this development takes place mainly upon the stores secreted in the tissues of the Vine, and that root-action, or rather the formation of young roots, never commences in earnest until the young wood begins to colour brown at the base, except in cases where Vines are unnaturally forced to make roots by the application of hotbeds, which is whipping Nature faster than she is willing to go. At this point it is a question whether we are to utilise the increased power infused into the Vine by the action of young roots, for the purpose of filling and consolidating the wood and eyes of the Vine, which, although formed, are as yet spongy and imperfect; or whether we are to allow it to expend itself in the shape of laterals, which are in due course cut away. This period is to me the most important of all the year in Vine culture. It is the period when not only the quantity of food that is supplied to the Vine, but also its quality, should be duly weighed and considered, because it is from this dormant supply that Nature first brings herself into play the following season. One of the mysteries of Vine growing is the not being able to estimate exactly the quality of the material of which a Vine is composed. Vines, like human heads, are very much alike, but like the heads there is often a vast difference in the quality of the matter they contain. For example, we find people who are not gifted with very strong powers of observation supposing that because a Vine produces big leaves it is an evidence of skill, whereas a condition the reverse of this is attested by a comparison of results, and the cause of the difference is in the quality and quantity of fruiting matter that the Vine contains, and I very much doubt if we should add to the stock of either by allowing the laterals to grow without restriction. *W. Hinds, Canford Gardens, Dorset.*

**Schizanthus pinnatus.**—I was pleased to notice Mr. Ellis's high commendation of this plant at p. 724. We used to grow it rather extensively, but somehow it has got crushed out of cultivation of late years. Mr. Ellis describes the best mode of managing it for spring flowering, but it is also a very useful plant for blooming in the autumn; for this purpose it may be sown in May or in June, grown on in cool pits, or even in the open air, till the middle of September or beginning of October. Placed on a light shelf in the conservatory it will continue flowering till Christmas in a temperature of 45° to 50°. It is extremely useful at that transitional season of the year, and the curiously marked and formed flowers afford a striking contrast to most of the flowers of autumn. The *Schizanthus* is also a useful plant for cutting for the decoration of small vases, and the flowers mounted singly, and skilfully used in bouquets, produce an effect different and distinct from almost any other. *D. T. Fish.*

— Having grown the different varieties of *Schizanthus* for many years as pot plants, I can fully endorse all that was said in their favour in last week's issue, and would strongly recommend any one having a supply of cut flowers to keep up, or

greenhouses or conservatories to render gay, to sow at once, and give these lovely annuals a trial; and if well grown and cared for they will be found among the most useful and showy plants that can be had for either of the above purposes. Just now we have a *Jardiniera* of the kind known as *S. Grahami* and *Grahami alba*, and very beautiful the group looks blended together, the different colours when associated in this way showing up in most pleasing contrast with each other. The same may be said of them used in a similar way in glasses when cut, where they look as aerial and choice as many of the Orchids; and an additional recommendation of them for this work is that they last fresh and in good condition for a considerable time. Sown now they will come in fine for the autumn, till when, after being potted off and nursed on in frames, they may be grown outdoors; but to keep them healthy and free from red-spider it is necessary to plunge the pots to ward off the sun from their sides, and so prevent a too rapid drying of the balls of earth, a thing inimical to vigorous root-action. To have a succession in spring, seed should be sown again towards the end of August, and the plants resulting from such sowing wintered on a light airy shelf near the glass, where they can be kept strong; and these, potted on in March or April, will be at their best at this season. The most floriferous of all the kinds is *S. papilionaceus*, a variety of the old *S. pinnatus*, the blossoms of which, as its name implies, resemble butterflies, and this likeness not only relates to the form of the individual blooms, but to their exquisite markings, the petals being spotted and blotched in the manner peculiar to those remarkably handsome insects. Although so distinct in habit to *S. Grahami*, *S. papilionaceus* succeeds under the same kind of treatment; but like all annuals, both require rich soil and plenty of liquid manure when growing and flowering. Not only are these *Schizanthus* valuable for pot culture, but in warm situations they are almost equally so outdoors, as they do well in beds or borders during the summer months, and when so used should be sown under glass and raised to planting-out size in the ordinary way. *J. S.*

**German Gardeners in England.**—There are several points in regard to this matter not adverted to in your abstract at p. 727. There are some good grounds for Englishmen—by which I mean the gardeners of Great Britain and Ireland—complaining of German competition. Wages are miserably low in Germany, and all young men are liable to conscription. The low wages and fear of forced military service drives many and keeps most of those so driven out of the country. There is hardly anything that many of these young men will not rather do than return to their Fatherland. I had a striking example of this some years since. A young German had the offer of a royal situation near Berlin. He declined to accept it, though only a journeyman at the time. On investigation I found the wages offered were only £50 a-year. The fear of the conscription was even more potent than the unwillingness to accept low wages. This fear arises less from the dread of military service than from the tyranny, as he expressed it, of the officers, who were apt to rule with a rod of iron over the rank and file. With such a dread of conscription, and perhaps of punishment far exceeding it, it is little wonder that the German gardeners prefer to remain in England. It is also quite possible that were more of them to come and stay, the effect on the wage question would be damaging to native gardeners. There is another point that our young men ought to lay to heart. Most of the German gardeners I have met with have more polish and better manners than many of our own countrymen; I have, in fact, heard of not a few German and other foreigners who have been almost shocked at the roughness of some of our young gardeners. Of course, in such a large profession as ours, there must needs be a few roughs, and no doubt the majority of our young men are, as they ought to be, gentlemen; but nevertheless not a few of them have a brusqueness of manner which renders them less agreeable than they might make themselves to their immediate superiors, and this also tells against their obtaining and keeping situations. Though no one could more sternly condemn anything in manner or voice approaching servility, yet there is no necessary connection between true independence of character and a brusqueness which may be mistaken for rudeness. Neither does mere ability or character compensate for the lack of manners. Gardeners, from the very nature of their profession, are brought much into direct contact with their employers. Their gentle art should also beget gentle manners. In this intensely utilitarian age it may be added that the latter also pays, for though manners may not make the man, the want of them leaves the best man very imperfectly furnished for the duties of a modern gardener. Other conditions also being equal, the man with the better manner will always have the pick of the best places, and will be likely to keep them the longest. There is nothing in this to alarm native

gardeners, as there is no reason in the world why the English, Scotch, and Irish gardeners should not equal or excel the most accomplished foreigner in manners, as they mostly do in special knowledge and practical ability. A little more sweetness and light—that is, culture of the lighter graces of character—and our young men need not fear to hold their own in that foreign competition, which may probably become more keen and close as horticulture advances, and while wages continue lower on the Continent than in England. Possibly, however, as the gentler arts gain more power over men, they may begin to think less of war; and conscription and other hardships which it involves, such as low wages, may cease. Peace hath its victories as well as war, and among those of the future may be an international conservatory, extending from Paris to Berlin, furnished with the richest and most costly vegetation of the world, which might, so it was said, have been built with the money expended on the late Franco-German war. Should the future furnish us with such victories as these, all the foreign gardeners will be wanted at home, with a few pushing Scotchmen to boot. *D. T. Fish.*

## Reports of Societies.

**Royal Botanic: June 16.**—The last and the best show of the season, held by the Royal Botanic Society, came off on Wednesday under the most deplorable circumstances as regards the weather. It rained hard almost the entire previous night, which did not appear, however, to have any effect in reducing the number of competitors, but from morn till night, when fine weather was most wanted, it rained incessantly—a drenching downpour that utterly spoilt the enjoyment of the visitors, of whom, notwithstanding the wet, there was a good muster. Every preparation had been made for the promenade on the wide stretch of grass on either side of the broad walk, which is so characteristic a feature of these summer shows; but promenading was entirely out of the question, and at 4 o'clock, when all should have been serene and gay, the grass was in the full possession of a flock of ducks from the neighbouring pond—a most tantalising sight for the authorities, who did all they could to make things pleasant. That such wretched weather should have prevailed is the more to be regretted, inasmuch as the show itself, for brilliancy of colour and general excellence of quality throughout, was of a higher order of merit than usual. The brightest and freshest masses of colour were furnished by the Orchids, and Show, Fancy, and Zonal Pelargoniums, all of which were abundantly represented. Of the sections devoted to stove and greenhouse flowering and fine-foliaged plants, exotic Ferns, and Heaths, we need say but little. Each section was well represented, but for the most part the plants shown were the same as were exhibited at South Kensington last week. Mr. Tudgey again took the lead with flowering plants, the next most successful competitors being Messrs. Jackson & Son, Mr. D. Donald, gr. to J. G. Barclay, Esq., Knott's Green, and Mr. Rann. Mr. Tudgey also beat the last-named exhibitor with fine-foliaged plants, and Mr. Rann likewise suffered defeat in the class for six exotic Ferns.

The Orchid classes were especially well contested. For twelve, amateurs, Mr. Spyers, Orchid grower to Sir Trevor Lawrence, M.P., came in 1st easily with a grand lot, consisting of *Masdevallia bella*, with twelve expanded blooms, *Cattleya Warneri*, a good dark variety; *Oncidium macranthum*, very strong and well bloomed; *Lælia Brysiana*, with three strong spikes; *Oncidium phymatichilum*, *Odontoglossum vexillarium roseum*, *Cypripedium niveum*, a mass about 18 inches over; *Masdevallia Harryana violacea*, grandly bloomed; *Calanthe veratrifolia*, with about eighteen spikes; a splendid specimen of *Cypripedium Dominionum* ×, with about sixteen spikes; *Cattleya Mendelli*, and *Saccolabium retusum*. Mr. Reeves, gr. to C. Hart, Esq., Lee, was 2d; and Mr. Heims, gr. to F. A. Philbrick, Esq., 3d. In the corresponding class for nurserymen, Mr. B. S. Williams as usual was at the top of the list with a group of large and well-flowered plants, most of which have been shown before. Mr. H. James was 2d. The same order prevailed in the trade class for six—Mr. Williams, 1st; Mr. James, 2d; and Messrs. Jackson & Son, 3d. The corresponding class for amateurs brought another nice fresh group from Sir Trevor Lawrence's collection, which came in 1st without any trouble, the other awards going to Mr. J. Child and Mr. Heims. The new tuberous-rooted *Begonias* were well shown by Messrs. John Laing & Co., Mr. James Tong, and others; Roses in pots by Messrs. Paul & Son, Cheshunt; Show and Fancy Pelargoniums by Mr. Wiggins, gr. to H. Little, Esq., and Mr. Turner; and Zonal Pelargoniums—a splendid half dozen—by Mr. Catlin, gr. to Mrs. Lermite, Finchley, who was a long way 1st in this class. His plants were from 3 to 4 feet over, well clothed

with good foliage, and splendidly bloomed—especially a plant of the fine salmon-red Fanny Catlin, sent out by Messrs. James Carter & Co. about two years ago, and which, as shown, was a perfect model of a pot Pelargonium.

Miscellaneous collections were not quite so numerous as usual, but of very great excellence. The largest groups came from Mr. B. S. Williams and Messrs. James Veitch & Sons, the last-named firm especially showing a singularly interesting and beautiful lot of really good plants. Mr. Williams' group also, we think, contained a greater variety of subjects than usual, the plants were besides well grown and grouped most successfully. The most startling novelty in this department was a group of about 200 plants of *Todea superba*, the many shades of green in whose fronds were to some extent blended and relieved with a thin admixture of Orchids and small fine-foliaged plants, which seemed to have a setting of green velvet. Messrs. E. G. Henderson & Son were the exhibitors. Messrs. John Laing & Co. also contributed a large and varied assortment of well-grown plants.

The display of fruit, though much inferior to that at South Kensington last week, was nevertheless much better than has been seen here for some time. The class for a collection which used to bring out something like a competition, on this occasion only tempted two competitors—Mr. Wildsmith, gr. to Lord Eversley, and Mr. W. Robins, gr. to E. Dyke Lee, Esq., Hertwell House, Aylesbury. The former had no difficulty in winning the 1st prize, with excellent examples of Black Hamburgh Grapes, President Strawberries, Brown Turkey Figs, Royal George Peaches, Sutton's Lord Beaconsfield Melon, and a Smooth Cayenne Pine. Mr. Robins' strongest points were splendidly coloured *Violette Hâtive* Nectarines, Noblesse Peaches, Dr. Hogg Strawberries, and Eastnor Castle Melon, his weakest dish being his Grapes. The Pine classes were anything but good. For a single Queen, Mr. J. R. Stirling, gr. to H. H. Vivian, Esq., M.P., Park Wern, Swansea, was 1st with a well swelled fruit, whose only fault was an ugly crown. A handsome fruit, not named, shown by Mr. J. Muir, gr. to C. M. R. Talbot, Esq., Margam Park, was placed 1st in the class for any other variety; and the rest were poor indeed. The two best pairs of Melons, in a weak class, came from Mr. James Bolton, gr. to W. Spottiswoode, Esq., Combe Bank, Sevenoaks, and Mr. G. Holliday, gr. to J. Morris, Esq., Castle Hill, Bletchingly, and both had the same varieties—Golden Queen and Scarlet Gem. Of seven exceedingly good baskets of black Grapes, the best came from Mr. Woodbridge, gr. to the Duke of Northumberland at Syon House—a first-rate sample at all points. A capital sample, scarcely so large or so black as Mr. Woodbridge's, shown by Mr. J. Bashford, gr. to H. Brenchley, Esq., Charlton House, East Sutton, came in 2d; and Mr. W. Robins was 3d, with a sample noteworthy for good berries, but not so even as the foregoing. Two baskets only of white Grapes were shown, and Mr. Woodbridge again took the lead with a capital lot of Muscats; and the other exhibitor, Mr. W. Mowbray, gr. to the Earl of Leven and Melville, took the 2d prize with very good Buckland Sweetwater. There were also seven dishes of Black Hamburghs, and in this class Mr. Wildsmith secured the highest honours with a fine sample, large in bunch and berry, and well finished. Mr. W. Robins, who came in 2d, had smaller but well finished bunches; and a nice sample, wanting only a little more bloom, from Mr. P. Feist, gr. to R. J. Ashton, Esq., Bishopsgate House, Staines, was 3d. Mr. Bolton, Mr. Wildsmith, and Mr. Mowbray took the awards in the order named in the any other black Grape class, and all showed Black Prince. The best dish of Muscat of Alexandria came from Mr. John Maher, gr. to C. Alhusen, Esq., Stoke Court, Bucks; and in the other class Mr. Bolton was 1st with very good Buckland Sweetwater, Mr. Robins 2d with Foster's Seedling, and Mr. Mowbray 3d with Buckland Sweetwater. Peaches and Nectarines were not numerous, but all good. For the best two dishes of the former Mr. G. Osborne, manager, Kay's Nursery, Finchley, was 1st, with Royal George and Grosse Mignonne, of very fine quality. Mr. Bones came 2d, with excellent examples of *Bellegarde* and *Violette Hâtive*; and Mr. C. Goldsmith was 3d, with Grosse Mignonne and Early York, rather small but splendidly coloured. A magnificent dish of Elruge, and a splendidly coloured sample of Hunt's Tawny, shown by Mr. Kemp, gr. to the Duke of Northumberland at Albury Park, were the best Nectarines staged. The second best, beautifully coloured fruits of Downton and *Violette Hâtive*, came from Mr. Tucker, gr. to J. L. Lovibond, Esq., Farnborough; and the 3d from Mr. G. Halliday. The Strawberries call for no comment, being few in number, and not first-rate. In the miscellaneous class Mr. J. Hopkins, High Cross, Framfield, showed half-a-dozen fine fruits of a seedling Melon, named High Cross Hybrid, a large, oval, handsomely netted fruit, with thick green flesh, to which the judges awarded a First-class Certificate.

## NEW PLANTS CERTIFICATED.

Botanical Certificates of Merit were awarded to Messrs. James Veitch & Sons for *Pinanga Veitchii* a new Palm sent home from Borneo by Mr. Peter Veitch and Mr. Burbidge, with the broad bipartite leaves prettily blotched with olive-green; for *Acer polymorphum septemlobum elegans*, which has cuspidate serrate leaflets, quite a bright red, almost scarlet, while young; for *Quercus cuspidata argenteo-variegata*, a boldly variegated, small-leaved shrub as shown in a small state; for *Laelia Philbrickiana*, a hybrid between *Cattleya Aclandiae* and *Laelia elegans*, with a very pretty rose-coloured lip; for *Croton Nevilliae*, an erect-leaved form, with the leaves about a foot long, green, marbled with gold, brightly variegated and very effective; and for *Pteris moluccana*, a bold-habited pinnate species, likely to be useful amongst the larger growing stove Ferns. To Mr. William Bull for *Ceratozamia fusco-viridis*, a pinnate species with broad leaflets, in the way of *Kusteriana*; for *Anthurium insignis*, a striking plant, already described; for *Croton insignis*, a bold handsome looking plant, with arching leaves about 18 inches long and 2 inches in width, grass-green, mottled with yellow; for *Adiantum aneitense*, a free-growing species in the way of *A. Cunninghamii*, with gracefully arching fronds; for *Oncidium crispum grandiflorum*, a well-marked form, with large chocolate-brown flowers, yellow in the centre; for *Selaginella involvens variegata*, belonging to the rosulate type, and having the short flabellately-branched fronds here and there marked with white variegation; for *Dieffenbachia rex*, a noble-leaved plant, of a dark bottle-green freely mottled with paler green; and for *Lilium nitidum*, a pretty species growing from 1 to 2 feet high, with the leaves arranged in whorls, and the drooping flowers small, apricot-coloured, with black spots. To Messrs. E. G. Henderson & Son, for *Crinum petiolatum*, an evergreen species, with bold, well-formed white flowers—one of the finest of the genus; for *Quercus cuspidata argentea variegata*, the silvery variegated plant also shown by Messrs. Veitch; and for *Freesia odorata*, a charming greenhouse bulb, with distichous leaves and funnel-shaped, sweet-scented flowers, white, with a yellow spot. To Mr. B. S. Williams, for *Croton Rodeckiana*, a long, narrow-leaved form, variegated with green and pale yellow, and the midrib of a pale tint of crimson—in the matured leaves the ground colour is suffused with a creamy-pink tint; for *Asplenium Baptistii*, with leathery bipinnatifid fronds; for *Nepenthes compacta*, a close-growing plant, with short, broad leaves, and having the pitchers freely mottled with bright chocolate-red; for *Pteris internata*, an elegant little West Indian Fern, with erect bipinnate fronds; and for *Cyphokentia robusta*, a handsome Palm with bold pinnate fronds.

Floricultural Certificates were awarded to E. B. Foster, Esq., Clewer Manor, for Show Pelargonium Alice, soft rosy-scarlet, with dark maroon blotch and a white centre; Emperor William, a finely-shaped white-centred flower, with the lower petals salmon-red shaded with crimson, and the upper ones deep maroon edged with scarlet, and Minotaur, remarkable for its depth of colour, very dark maroon upper petals, and rosy-scarlet lower ones. To Mr. Turner, for Show Pelargonium Martial, one of M. Bréhaud's seedlings, which is much in the style of Emperor William, but with dark scarlet lower petals; and for Fancy Pelargonium Sarah Bernhardt, a smooth, good-shaped, bright rose flower with a white centre, and the petals margined with white. To the Rev. A. Matthews, Gumley, Market Harborough, for Pelargonium Russell, also much in the style of Emperor William, but with the colour of the lower petals intermediate between the former and Martial. They are all good additions to the dark-coloured section. To Messrs. J. Peed & Son, for Pelargonium Duchess of Connaught, which appeared to be of somewhat intermediate character between the Show and Fancy types, both in habit and size of flowers, which are white, with dark purple-coloured spots. To Messrs. J. Veitch & Sons, for *Coleus Acme* and *C. Pharo*, both novelties of a striking character. The former has leaves of a rich shade of maroon, with bold crimson midribs, and a yellow blotch at the base; the latter has claret-coloured leaves, also yellow at the base, and the centre of the growing points yellow, with the tips of the young leaves of the prevailing ground colour. To Mr. Chambers, Westlake Nursery, Isleworth, for *Lobelia magnifica alba*, a very compact-growing and free-flowering plant, with large white flowers. To Messrs. Osborn & Sons for *Begonia Madame Triquaneaux*, a fine-leaved variety of the Rex type, with dark, silvery metallic leaves, with a well-defined edge of bronzy-green spotted with the same silvery hue as the centre. To Messrs. E. G. Henderson & Son for *Begonia argenteo-zebrina* and *Begonia Comtesse de Thellusson*—the latter with very dark green leaves, and the former a very distinct plant, with bronzy-green leaves heavily spotted with silver-grey. To Mr. B. S. Williams for *Coleus Mrs. G. Simpson*; and Mr. William Bull for *Cereus C. M. Hovey*, a fine variety in the way of *C. speciosissimus*.

**Edinburgh Botanical: June 10.**—The Society met in the classroom, Royal Botanic Garden; Mr. Gorrie, President, in the chair. The following communications were read:—

I. Remarks on *Rheum nobile*, Hook. fil., which has flowered in the Royal Botanic Garden, Edinburgh; illustrated with coloured drawings by Miss Woon. By Dr. Halfour, F.R.S., Emeritus Professor of Botany.

This plant, as already noticed in the *Gardeners' Chronicle*, has flowered within the last few weeks, and has attracted the attention of many visitors. Its original habitat is the Sikkim range, and the seeds were obtained seven years ago from Dr. King of Calcutta. The plant is now fully 3 feet 9 inches high, and promises to perfect seed. This is the only known instance of the plant flowering under cultivation in Europe.

II. New Forestry Inquiries Established by the Conservator of Forests in Oudh. By Sir Robert Christison, Bart.

Captain Wood, of the Oudh Forest Conservancy, has determined to undertake an inquiry into the objects contemplated in Sir Robert Christison's first paper on the Exact Measurement of Trees, published in the Society's *Transactions*, and for that purpose has sent copies of the directions for exact measurement to the whole of the districts under his charge, desiring his subordinate officers to make preparations for an inquiry in each. With that view Captain Wood has issued instructions to set apart in each forest district a plot of a quarter of an acre, which is to be duly trenched all round for drainage and separation, and in which the trees are to be cut down or planted so that each tree fixed on for observation shall be 15 feet distant from every other. Directions are also given for numbering the trees, and tabulating the results, and the requisite instruments are supplied by the Conservancy establishment. Lastly, instructions are added for noting all peculiarities of soil, climate, elevation, exposure, and treatment. It seemed right that this Indian experiment should be made known to our numerous forest owners at home. If the example thus set at a distance were followed here, important results would be obtained for the advancement of tree culture.

III. W. B. Boyd, Esq., of Ormiston, gave in the report of the annual trip of the Scottish Alpine Botanical Club, made in July and August of 1879, to Killin, for the purpose of exploring the upper portion of Glen Lochy. The sun only appeared on one of the else rainy four working days, but the view then had from a mighty Ben of far stretching neighbour peaks, with the accompanying silvery streaks of lochs in the valleys, amply compensated for the previous drenchings and other discomforts. Amongst the most plentiful finds were *Arctostaphylos*, gathered every day; *Cystopteris montana*, *Bartsia alpina*, *Woodsia hyperborea*, *Juncus castaneus*, as well as several fine Orchids. In the varieties were a very pretty variety of *Saxifraga hypnoides*, the white petals of which were each tipped in most delicate rose-colour, but this had not been retained in cultivation. On the table was another of the finds, a beautiful variety of *Veronica saxatilis*, successfully cultivated by Mr. Lindsay. This had pink petals.

Mr. Potts, of Fettes Mount, showed amongst other growing plants a *Saxifraga* with beautiful yellow petals. It was found in a spur of the Cairn Gorm Mountains near Dalwhinnie, in 1877, and still retained its special colour under cultivation. Mr. Boyd said the plant was undoubtedly *Saxifraga aizoides* var. *aurantia* of Wood's *Tourist's European Flora*. It was common on certain stations on the Alps, but a station for it had been previously unknown in Britain.

IV. Isaac Anderson-Henry, Esq., of Hay Lodge, Trinity, exhibited a number of rare plants from his garden. A specimen of *Exarrhenna Lyallii* had been raised from seeds sent from the middle island, New Zealand. Two plants had stood on the rockery at Trinity all last winter. It is closely allied to the *Myosotis* tribe. It is one of the most manageable of New Zealand plants, and is a perennial. A specimen of *Morina Coulteriana*, which had been sent with the seeds of two other species of *Morina* from Kashmir some three years ago, is wholly new to this country. It has stood with *M. Wallichii* in the open ground these two bypast winters, and so is undoubtedly hardy. Mr. Henry had in fair growth with him, though planted so late as November, 1879, a number of plants sent home from Afghanistan. They included *Borago* two species, *Codonopsis* species, *Rheum* species, *Liliaceæ* from 12,000 to 14,000 feet, *Althæa* species, wild *Celery*, and a *Primula* species, taken at 9000 feet, as well as another yellow *Morina*. A strongly perfumed species of *Thymus* now on the table was also received with this parcel. A pretty little shrub of *Veronica Lyallii*, from the northern island of New Zealand, was also exhibited. A plant of this had stood in Hay Lodge rockery all last winter. Though the seeds were sown three years ago it is only now about 8 inches high. One plant flowered partially with Mr. Henry last year, from a sprig of which Sir Joseph Hooker figured it in the *Botanical Magazine*, t. 6456. The height he assigns to it in his *Flora of New Zealand* is 5 to 15 inches. The flowers on the specimen were pure white, and streaked all over with pink veins, each flower being quite equal and rather more than half an inch across. Another inhabitant of the northern island of New Zealand, *Veronica diosmaefolia*, was also on the table. It is not so hardy as the *Veronica* just described, has pretty pink flowers and decussate foliage, flowers early, and remains long in bloom. The specimen under discussion was raised from seed sown in July, 1877, and flowered at a height of some 8 inches. Sir Joseph Hooker states the total height gained by the shrub to be from 3 to 12 feet.

V. Report on the effects of last winter in different parts of Scotland, and on the progress of open-air vege-

tation at the Royal Botanic Garden, from the beginning of May. By Mr. John Sadler, Curator.—During this May the thermometer was at or below the freezing point on four occasions, as contrasted with the eight occasions during the same month of last year; the register for that month was 12° of frost, as against 7° this season, which had been also distinguished by a comparatively low temperature, along with the prevalence of northerly and easterly winds. Although there had been a good deal of bright sunshine, yet the drying winds and the want of drenching rains had checked vegetation very much. Still spring herbaceous plants, specially bulbs, had ripened in the garden. From the beginning of January to the present date 470 species and varieties of plants had flowered in the rock garden, and there were now species of ninety-two genera in flower, including the beautiful Cape *Senecio speciosus*. Amongst many reports from different districts of Scotland regarding the effects of last winter on vegetation, it was stated that at Ormiston, near Kelso, the thermometer registered on the night of December 4 18° below zero. This summer no flowering tree but the Rowan had blossomed there. At Dalkeith 26° of frost were read, the lowest temperature recorded since Christmas, 1860; while at Glamis Castle the winter had been comparatively mild, and only a few Roses had been killed.

Mr. Buchan, with reference to the above report, mentioned that at Springwood Park, Kelso, a reading had

in 1878, from New Galloway. The only previous record of it in England, so far as Mr. Berkeley knew, was in 1790.

Alexander Campbell, Esq., presented to the museum a section of an Oak, 145 years old, felled in the spring of 1879, at Cammo, at 2 feet from the roots. The centre was considerably decayed for 2 feet nearly. The longest diameter of wood measures 37.4 inches; transverse, 35 inches; long radius of that diameter, 19.8 inches, short, 17.6; girth over bark, 9 feet 3½ inches. Sir Robert Christison, Bart., through whom the gift was procured, has appended a neat scale one half the natural dimensions, showing the relative width of the annual layers of both radii of one diameter by decades of years. After an approximate equality for forty years, one overtops the other; a portion of one side appears to stop after 100 years or so.

W. B. Boyd, Esq., of Ormiston, showed a beautiful abnormal form of the common Daisy.

Mr. W. P. Drummond, of Messrs. Drummond, seedsman, intimated that his firm had at present a plant of *Lilium giganteum* in flower about 8 feet high.

Amongst the plants in pots exhibited from the garden were *Androsace Chamajasma*, *Dianthus alpinus*, *D. neglectus*, *Edraianthus Kitaibeli*, *Ertilaria kamtschatica*, *Gypsophila cerastoides*, *Hutchinsia alpina*, *Linaria origanifolia*, *Saxifraga cressa*, and *Senecio speciosus*.

FIG. 138.—RHEUM NOBILE.

been taken at 16° below zero, which was 4° lower than any reading that, so far as he was aware, had ever before been registered in the British Isles, being in reality considerably lower than that reported from Ormiston, which was obtained on an exposed thermometer, while at Kelso the instrument was protected. The fatality to trees in this district might be attributed to the abnormal growth of wood caused by the fine autumn which here followed the sunless summer of 1878. In connection with this Mr. Dunn showed a bush of Holly berries from Dalkeith, where it had survived the severe winter which killed the blackbirds, who else would have fed on them.

VI. Miscellaneous communications.

Mrs. Bain, of Napier Road, Merchiston, a Lady Associate, exhibited a fine specimen of the Edelweiss in flower.

Mr. Campbell, of Ledaig, Argyleshire, sent Strawberries which had ripened there, in the open ground, on May 29.

The President gave to the garden specimens of the *Lavatorea arborea*, two varieties, one of which he had recommended to be cultivated as a fibre producer, also a specimen of variegated *Holcus mollis*.

The Rev. John Stevenson, of Glamis, Forfarshire, sent a fine specimen of *Hypoerea parmelioides*, Mont. (*H. ricciodea* Berk.; *Sphaeria ricciodea*, Bolt.), for the herbarium. It has an oblong ovoid figure, with spoke-like filaments radiating from its centre, and anastomosing. This fungus had been found by Mr. James McAndrew

**Scottish Horticultural Association.**—The ordinary monthly meeting of this Association was held in 5, St. Andrew's Square, Edinburgh, on Tuesday, the 1st inst. There was a good attendance of members. The President, Mr. M. Dunn, Dalkeith Park Gardens, occupied the chair. Mr. John Downie, Pinkhill Nursery, sent a paper on "Florists' Flowers—Past and Present." He stated that in his youth the Dahlia was the most popular florists' flower, the first plant of which the essayist had seen as early as the year 1828; it was not till two years afterwards that the first double Dahlia was raised, and was sent out the following year. In these days the common size of this plant was about 8 feet high. Dahlia Beauty of Sheffield was sent out in 1834. At this time, while gardener at South Bank, near Edinburgh, he set out on a visit to the late Mr. Thomson, gardener at Craigie Hall, for the purpose of seeing this Dahlia, which was creating a great sensation in the florist world. Springfield Rival, a great flower in its day, was given to the public in 1835, and Beauty of the Plain in the following year. Dahlias became very popular about 1840, when as much as £200 was given for the stock of a new plant. The late Mr. Young, of Archerfield, did much to advance the culture of this flower. In preparing ground for planting out it was necessary to dig or trench and manure well. The next florists' flower described was the Pansy. Named varieties of this flower had been sent out since 1830. Fancy Pansies were not printed in a catalogue till 1862. Three years previous to this six varieties were given to the public, one of which named Dandie Dinmont,

was very popular. Violas, now so much used in bedding, were brought prominently before the public by Messrs. Dickson & Co. Pentstemons were next alluded to: from 1833 to 1850 Continental sorts were largely grown. Antirrhinums, he said, were very much improved since 1840, when there were only a few good sorts. The Fuchsia was first introduced into England by Mr. Lee, who bought the stock from a sailor's wife for £8, and shortly afterwards sent out 300 plants at £1 1s. each. In the year 1835, the late Mr. John Young raised Fuchsia Riccartoni. Hollyhocks were introduced in 1834. The name of the late Mr. David Foulis, of Woodhouselee, would always be associated with the popularising of this florist flower. In Phloxes, the late Mr. Cozzar, of Kingsmeadows, did much towards their cultivation; one of the best he raised was Countess of Home. Pelargoniums attracted considerable attention in 1835; about that time Tom Thumb Scarlet was raised. The first Calceolarias he had seen were in 1833. The Cineraria, Snowdrop, and Rosemary, were then referred to. Throughout the paper Mr. Downie related several racy incidents connected with the introduction and exhibition of new flowers in his early days. The paper throughout was listened to with great interest.

Mr. Emil Fischer, of the Lawson Nursery, next communicated a paper, the subject of it being Flowering Stove Exotics. He dwelt principally on the *Dipladenia* and *Allamanda*, both of which were held in high estimation as flowering stove plants, in fact none of this class were more deserving of general culture. He described the method of propagating the former by putting them singly into pots. In regard to watering they were most impatient of an over-supply; the soil required to be removed from the roots once a year, and the best time for doing this was immediately after they were cut back, probably in the month of August or September. As a means of keeping them healthy and clean he recommended frequent syringings with pure water. Plants trained in the form of a balloon looked better than in any other shape. Allamandas, although not so generally useful as the foregoing, were still very fine for showy purposes. This plant was rather partial to abundant waterings, and needed a temperature not under 65°; the most useful variety in this class was *grandiflora*, which could be easily propagated from cuttings.

The following certificates were granted, viz., to Mr. Charles Wilson, Summerhow Nursery, Kendal, for a new double white seedling Zonal Pelargonium of dwarf habit and a free flowerer, named Mrs. Wilson. To Messrs. Dicksons & Co., for Fancy Pansy named Perfection, maroon ground, with yellow belting. To Messrs. Downie & Laird, for Fancy Pansies Robert Laird, Jun., maroon and yellow edge; and Mrs. Dewhurst, purple, with white edge. The following articles were commended:—New double pink Geranium named Summerhow Gem, from Mr. Charles Wilson, Kendal; a strain of Mimulus flowers from Messrs. Dicksons & Co.; and a Fancy Pansy, named Mrs. Robertson, from Messrs. Downie & Laird.

The other exhibits on the tables were a collection of Fancy Pansies from Messrs. Downie & Laird, a collection of Fancy Pansies, double seedling Potentillas, double Tropaeolum flowers, and *Saxifraga MacNabiana* in flower, from Messrs. Dicksons & Co.; a collection of Regal Pelargonium flowers from Thomas Methven & Sons; Orchids, and a Gloxinia, from Ireland & Thomson; and a collection of herbaceous plants in flower from Mr. George Robertson, Mordington Gardens, Berwick-on-Tweed.

**Paris Horticultural Society's Annual Show.**

—This show took place as usual in the Palais de l'Industrie, Champs Elysées, and was open from the 5th to the 8th inst. It was quite up to the average of former displays, the most attractive groups being without doubt Vallerand's collection of new seedling Gloxinias, and Bleu's Caladiums. But let us begin by a brief description of the several groups exhibited. MM. Eroux et Fils, nurserymen, of Vallée d'Aulnay, had a very fine group of large plants of *Kalmia latifolia*, which it appears did not suffer from the effects of the last winter. In the centre stood a good specimen of *Rhododendron Sherwoodianum*. Round this group were some nice well-flowered plants of the dwarf *Kalmia myrtifolia*. The same firm had another group of Conifers, comprising specimens in the following sorts (they were most of them small plants):—*Juniperus Sabina*, *J. Sabina variegata*, *tamariscifolia*; *Abies excelsa nana*, *Sciadopitys verticillata*, *Abies orientalis*, concolor, excelsa, Nordmanniana, Engelmanni; *Retinospora plumosa*, obtusa, squarrosa, pisifera; *Thuopsis Standishii*, dolabrata; *Thuja Ellwangeriana*, Lobbii, &c. These gentlemen received a Gold Medal. M. A. Lecaron, seed merchant, of 20, Quai de la Mégisserie, received a Silver Medal for a large collection of annuals—Pansies, Zinnias, herbaceous Calceolarias, Mimulus, &c. MM. Couturier & Robert, nurserymen, of Chalon, near Paris, a Silver-gilt Medal, for a good group of bulbous Begonias, their own seedlings—M. Lequin, red; Henri Couturier, orange-red; M. Pigny, red; M. Mathieu, red; a nice rose-coloured variety, not named, &c.

Messrs. Chantrier Frères, of Mortefontaine, had a most effective group of fine Crotons, their own seedlings, large and healthy specimens, including fine large plants of Baronne James de Rothschild, two of Bergmanni, one of Carrieri; these three have already been alluded to in the *Gardeners' Chronicle*. The other varieties were Baron Frank Selliere, Drouetii, long narrow leaves veined with red; Chantrieri, red leaves; interruptum elegans, figured in *Revue Horticole* not long ago; Truffautii latimaculatum, fine, centre pure yellow, bordered with green; and a few new seedlings not named. This group brought its owners a Medal of Honour.

Louis Chaté, nurseryman, of Paris, a Silver Medal for a collection of Echeverias and other small plants used in miniature carpet-bedding. M. Delahaye, of 18, Qua

de la Mégisserie, Paris, a Prize Medal for a collection of cut flowers, comprising twenty-five varieties of Delphinium, Ranunculus, Lilium atrosanguineum, Irises, Muscaris, Anemones, Amaryllis vittata rubra, &c. M. Saison Lierval, nurseryman, of Neuilly (Seine), a Gold Medal, for a group of *Latania borbonica*, a large specimen of *Rhapis flabelliformis*, *Chamaerops excelsa*, *Kentia Balmoreana*, *Fosteriana*; *Areca Baueri sapida*, *Phoenix tenuis*, *Livistonia Hoogendorpii*, *Poinsettia mexicana*, *Aracaria excelsa*, *Bidwellii*, *excelsa*, *glauca*; *Chamaerops humilis*, *tomentosa*, &c. M. L. Landry, nurseryman, of 92, Rue de la Glacière, Paris, a Silver-gilt Medal for a collection including *Cycas revoluta*, *Aspidistra*, *Latania borbonica*, *Rhapis flabelliformis*, *Aracaria Cunninghamii*, *Areca Verschaffeltii*, *sapida*; *Strelitzia reginae*, *Chamaedorea gracilis*, *Cyrtopodium villosum*, *caudatum*, a nice elegant plant; *Chamaerops humilis gracilis*; *Nidularium princeps*, *fulgens*, *Innocentii*; *Vriisia splendens*, *Bilbergia Legrellii*, *tristis*, *rhodocyanca*, *iridifolia*, *Leopoldii*; *Encholirion Saundersii*, *Youngii*.

We now come to a very interesting group, that of M. Bleu, the well known Caladium grower, who received a Gold Medal of Honour. His plants were all very fine. He had at the back of his Caladiums three Orchids well flowered, *Brassia verrucosa*, *Oncidium crispum*, *Oncidium pulvinatum*. We shall only note the best of his plants; Madame Marjolin-Scheffer, *Aristide*, *Virginalis*, pure transparent white with the mid and side ribs green, very fine; *Burelle*, *Ville de Mulhouse*, *Ibis Rose*, the colour of the bird so-called; Madame Audrien, *Perle du Brésil*, *Pyrrhus*, *Mithridate*, *Isidore Leroy*, *Reine Marie de Portugal*, *Emilie Verdier*, very curious; Walter Scott, *Jules Duplessis*, *L'albane Lepeschkinci*, *Baronne James de Rothschild*, *Madame Lemoine*, a very strange yellowish colour, not very attractive; *J. Linden*, *Triomphe de l'Exposition*, *Verdi*, very fine dark red ground, bordered with green and fringed; *Clio*, *Eucharis*, *Rubens*, *Salvator Rosa*, and some red-leaved seedlings not yet named; also a collection of foliage Begonias, amongst which we noticed *Louise Chretien*, *Jules Dehaussy*, &c.

M. Lacroix, gr., a Silver-gilt Medal for a collection of the newest Coleuses. M. Lemoine, of Nancy, a Bronze Medal for a seedling *Zonal Pelargonium*, very dark red. M. Evrard, nurseryman, of Caen, a Gold Medal for seedling *Pelargonium Emile Chaté*, double, flesh colour; *Richard le Noir*, dark red; *Engène Delamarre*, fine pink; *Malherbe*, flesh colour; *Alfred Dumesnil*, pale cherry; *Alice Rigault* and *Gloire de Crimée*. M. A. Dufoy, nurseryman, of Plateau d'Arron, Seine Loise, a Silver Medal for two lots of *Pelargonium*, *Gloire de l'Exposition*, white with a pink dot; *Madame Philippe Gautier*, pale pink and white. M. Aug. Roy, 162, Avenue d'Italie, a Silver Medal for a group of *Clematis*, including *Magnifica*, *Lady Caroline Nevill*, *Venosa*, *Madame Van Houtte*, *Excelsior*, *Eng. Delatre*, *Regina*, *Lucie Lemoine*, &c. M. Boutreaux, nurseryman, Montreuil, a Silver Medal for over one hundred varieties of *Geraniums*. M. A. Poirier, nurseryman, Versailles, a Silver-gilt Medal for another collection of *Geraniums*.

Messrs. Thibaut & Keteleer, nurserymen, at Sceaux, a Gold Medal for a very fine group of new *Pelargonium*: all of them will prove very useful, especially *Watteau*, dark red; *Madame Cleriet*, pink; *Queen Victoria*, *Pygmalion*, large flowers of a pleasing dark red; *Roseum*, very pale pink; *Artaban*, salmon; *Rebecca*, &c.

M. Lequin, nurseryman, Clamart, a Gold Medal, for bulbous Begonias, new seedlings not yet named, some of which will be very fine. Ernest Gonesse, nurseryman, Passy, a Gold Medal for plants for miniature carpet-bedding and also specimens of same. M. L. Renault, 15, Rue de l'Arcade, Paris, a Silver Medal for *Pyrethrum* in flower, white, pink, and pale pink. Albert Pantéche, Passy, a Silver-gilt Medal for miniature carpet-bedding, butterfly, bird, &c.

Messrs. Vilmorin-Andrieux, 4, Quai de la Mégisserie, a Medal of Honour, for very extensive collection of annuals, herbaceous Calceolarias, dwarf Tropaeolums, dwarf Phloxes, Mimulus, Pansies, Lobelias, &c. M. A. Chantin, an *Objet d'Art* for a fine and extensive collection of Palms, in large specimens, and also Aroids, such as *Anthurium magnificum*, *A. Dechardii*, *A. crystallinum*, *A. Scherzerianum*, *A. Ernesti Augusti*, *A. reflexum*, &c. The Palms included some of the following:—*Calamus Lewistanus*, *Kentia Balmoreana*, *K. Fosteriana*, *Martinezia caryotaefolia*, *Aracaria Baumanni*, *Cocos australis* and *Weddelliana*, *Pandanus Veitchii*, *P. ornatus*, *Sabal Adansonii*, *S. princeps*, *Ceroxylon niveum*, *C. andicola*, *Chamaerops humilis gracilis*, *Latania rubra*, *Corypha australis*, *Rhapis flabelliformis*, *Phoenix dactylifera*, *Areca sapida*, *A. lutescens*, *A. speciosa*, *Martinezia Lindeniana*, *Cyathea medullaris*, *Cibotium princeps*, *C. regale*, *Tillandsia Lindenii*, *Alsophila australis*, *Zamia borrida*, *Z. glauca*, *Cycas revoluta*, *C. circinalis*, &c. Facing this was another fine group of Palms, sent by the Town of Paris, from the Muette. The varieties were about the same as in M. Chantin's lot.

M. Jolibois, gr. to the Luxembourg Garden in Paris, sent a fine group of Bromelias, consisting of most of the known varieties, and having as a centre-piece a fine plant in flower of the *Vriisia Glaziovii*: the flower is high and very ornamental, though not very attractive as regards colour. M. Morin, gr. to M. Attias, at Neuilly, near Paris, a Gold Medal for a very nicely arranged group of miscellaneous plants, such as Coleus, Ferns, Palms, Begonias, Caladiums, Dracaenas, &c.

M. Savoye, nurseryman, Bois, Colombes, a Medal of Honour for a good group of Palms and other plants—*Pandanus Veitchii*, *P. reflexus*, *Theophrasta imperialis*, *Cardulovicia atrovirens*, *Dracaena Goldicana*, *Tillandsia tessellata*, &c. M. Paillet, nurseryman, Chatenay-les-Sceaux, a Silver-gilt Medal for a collection of very good cut flowers of *Paonies*, fresh and varied. M. Thiebaut-Legendre, a Silver Medal for *Mignonette*, *Pansies*, &c.

M. Porrier, gr. to M. Noël, a Silver-gilt Medal for a collection of Coleus and Caladiums. M. Matheu, 54, Rue Spontini, Passy, a Medal of Honour for a group of Palms, &c.—such plants as *Latania borbonica*, *Areca sapida*, *Rhapis flabelliformis*, *Ficus*, *Cycas revoluta*, &c. M. A. Eberlé, a Gold Medal for a good collection of succulent plants; and M. Simon, a Gold Medal for another collection of succulent plants. M. Morlet, of Avon, a Silver-gilt Medal for new Coleus not yet named. M. Moser, of Versailles, showed a large group of *Hollies*, *Kalmia latifolia*, and a few *Rhododendrons*.

M. Vallerand, nurseryman, Bois, Colombes, received a Medal of Honour for the very best group of seedling *Gloxinias* I ever saw, and about which I must send you another note. (See p. 780.) Messrs. Lévêque et Fils, Rose growers, of Ivry (Seine), surprised every one with their collection of standard and dwarf Roses. How the first-named escaped from being frozen has not yet been told. Their trees were in good health and the blooms very fair.

Fruits and vegetables were very badly shown in a dark corner, lying flat on the ground, which made it difficult to judge of their value. MM. Forgeot et Cie., 8, Quai de la Mégisserie, a Silver Medal for a Bean that is much talked about—the *Haricot Chevrier*. M. Margottin fils, of Bourg-la-Reine, showed forced Vines, Peaches, Nectarines, &c. M. Louis Lhéruart, of Argenteuil, a Medal of Honour for enormous Asparagus and a collection of Strawberries. M. Millet, Bourg-la-Reine, a Medal of Honour for forced Vines in pots and Strawberries. A lot of horticultural implements of all sorts, including houses, boilers, vases, pumps, &c., were shown in other parts of the building.

I was sorry to see that this show, which might be made most attractive, is still only considered by the Government as a means of showing up the sculpture, which is arranged in such a manner that you cannot without difficulty get near the several groups of plants and flowers shown. (From a Correspondent.)

South Essex Floricultural: June 10.—The annual exhibition of this old-established Society was held in the grounds of J. G. Barclay, Esq., Knott's Green, Leyton. It ought to be stated that, during the last few years, Mr. Barclay has thrown open his beautiful grounds and conservatories on the occasion of the annual exhibition of this Society, and this additional attraction to a first-class provincial exhibition has been the means of placing it on a sound basis. The exhibits were not quite so numerous this year as last, but the quality was exceedingly good. The eight stove and greenhouse plants exhibited by Mr. Donald, the gardener at Knott's Green, were superior to most of those exhibited in London this year; his *Darwinia tulipifera* was exceedingly healthy and well furnished with richly-coloured flowers. *Dracophyllum gracile* was also large and fine. Mr. Bones, gr. to D. McIntosh, Esq., had a good *Ixora floribunda nana*, a seedling raised in Mr. Fraser's nursery, of very dwarf habit, and which is not so well known as it ought to be. Mr. Douglas, gr. to F. Whitbourn, Esq., Loxford Hall, who competed in this class, also had a nice plant of *Ixora Williamsii*. The collections of Orchids were much more numerous than usual, and the plants, though small, were healthy and well-flowered. The best came from the collection of A. Borwick, Esq., Higham Hall, Walthamstow (Mr. Dover, gr.). In his collection was a very fine variety of *Oncidium macranthum* with fifteen flowers, a splendid form of *Cattleya Mendelli* and a beautiful *Cymbidium eburneum*. Mr. Borwick also exhibited *Odontoglossum polyxanthum*, probably the first time it has flowered in England. It has the leaves and pseudobulbs of *O. crispum*; the flowers, of which there were three on a spike, remind one of a good *O. triumphans*, but it cannot be even a good variety of that species, as its shorter and broader sepals and petals are different: these are broad deep yellow, barred and blotched with rich brown, the lip brown with a slight fringed creamy-white margin. Mr. Douglas exhibited a good *Dendrobium Devonianum*, and a richly coloured *Saccolabium ampullaceum*. J. R. Scott, Esq. (Mr. Ship, gr.), sent a nice group from his collection: he had a handsome *Oncidium concolor* and a good specimen of *Dendrobium densiflorum*; while W. Fowler, Esq. (Mr. Monk, gr.), exhibited a good plant of *Vanda Roxburghii* with several spikes of its pleasing flowers. Mr. Bones had a collection of fancy *Pelargonium*s, well flowered; while the large flowered section was well represented by fine specimens of the best varieties from Mr. Donald. Herbaceous Calceolarias were much admired: there were several good groups, but those from Mr. Bones were by far the best; the flowers were large, well coloured, the plants dwarf and healthy. The Cape Heaths, from Mr. Donald, were as well grown and flowered as such plants can be—*Ericas obbata* and *Candolleana* were very fine indeed. Mr. Douglas exhibited the best Ferns—*Adiantum concinnum latum* and *Todea superba* were remarkably good. While the same exhibitor was first for Palms, Mr. Monk carried the palm for fine-foliated plants. *Anthurium crystallinum* seems to be very popular as an exhibition plant. Cut flowers, always popular at country shows, after the fruit, were well represented. Mr. Douglas gained the principal prizes. There was a splendid lot of Black Hamburg Grapes from the gardens of Albert Spicer, Esq., Woodford (P. Darvill, gr.), the berries were large, black, and even. The 1st prize was most deservedly awarded. Mr. Bones exhibited good Buckland Sweetwater and very fair Muscats, also excellent Peaches, for all of which he gained 1st prize. The dinner-table decorations were very good, so were the single vases. Mr. and Mrs. Abbott, of Wanstead, and Mr. Medland, of Woodford, obtained the principal prizes. Amateurs of small means and cottagers are encouraged to exhibit, and they show

good vegetables and flowers. Mr. B. S. Williams, of Holloway, kindly aided the Society by sending a nice group of choice flowers. There were, of course, other interesting exhibits, omitted for want of space.

Obituary.

WE regret to record the death of Mr. JOHN SCOTT, latterly head of the herbarium department, Botanic Garden, Calcutta. He had come home on two years' sick leave, and died at his sister's house, Garvald, East Lothian, aged forty-two. Some sixteen years ago Mr. Scott was a working gardener, under Mr. MacNab, in the Royal Botanic Garden, Edinburgh, when the great merit of his papers, published in the *Transactions* of the local Botanical Society, as well as subsequently in those of the Linnean Society, attracted the attention of Charles Darwin, who procured for him an Indian appointment. Mr. Scott, after a short sojourn in Calcutta, was sent to Darjeeling, partly to pursue an inquiry into a disease of the Opium Poppy. On the hills he had excellent health, and it was only in his subsequent sojourn in Calcutta that he contracted the spleen disease, to which he has succumbed in his early manhood. A few weeks ago he revisited the old gardens of his apprentice-time, but only to show to his companions that he was the shadow of his former self. Mr. Scott has brought home with him a mass of valuable botanical MSS., which we trust will be duly cared for.

The Weather.

- June 10.—Fine, partially cloudy, and cool. Clear at night.
- 11.—Overcast till 2 P.M.; fine and bright after. Cool.
- 12.—A fine bright day. Cloudy in morning, clear afterwards. Cloudless at night.
- 13.—A very fine, bright, warm day. Light clouds. Cloudy at midnight.
- 14.—Generally dull. Slight rain at times. Heavy rain from 6 to 7 P.M. Occasional sunshine in morning.
- 15.—Overcast, dull, cold day. Occasional rain till 5.30 P.M. Heavy rain afterwards.
- 16.—Overcast, dull, and cold throughout. Rain fell till 5 P.M.

LONDON: *Barometer*.—During the week ending Saturday, June 12, in the suburbs of London the reading of the barometer at the level of the sea decreased from 30.01 inches at the beginning of the week to 29.64 inches by the morning of the 7th; increased to 29.88 inches by the night of the same day; decreased to 29.70 inches by the afternoon of the 8th; increased to 29.84 inches by the morning of the 9th; decreased to 29.79 inches by the afternoon of the same day; and increased to 30.05 inches by the end of the week. The mean reading for the week at sea level was 29.85 inches, being 0.21 inch below that of the preceding week, and 0.12 inch below the average.

*Temperature*.—The highest temperatures of the air observed by day varied from 68½° on the 12th to 59° on the 9th; the mean value for the week was 64°. The lowest temperatures of the air observed by night varied from 41° on the 10th to 49° on the 11th; the mean value for the week was 44½°. The mean daily range of temperature in the week was 19½°, the greatest range in the day being 27°, on the 10th, and the least 12°, on the 6th.

The mean daily temperatures of the air and the departures from their respective averages were as

follows:—6th, 53°.6, — 3°.9; 7th, 53°.2, — 4°.4; 8th, 51°.3, — 6°.4; 9th, 48°.5, — 9°.4; 10th, 51°.8, — 6°.3; 11th, 52°.9, — 5°.4; 12th, 54°, — 4°.5. The mean temperature of the air for the week was 52°.2, being 5°.8 below the average of observations extending over a period of sixty years.

The highest readings of a thermometer with blackened bulb in vacuo, placed in the sun's rays, were 144° on the 10th, 134° on the 7th, and 126° on the 12th; on the 9th the reading did not rise above 88°. The lowest readings of a thermometer on grass, with its bulb exposed to the sky, were 35° on the 10, and 37° on the 9th; the mean of the seven lowest readings was 40½°.

Wind.—The direction of the wind at the beginning of the week was W., but veered to E.N.E. afterwards; its strength was strong at times.

The weather during the week was generally dull and cold, though occasionally fine.

Rain fell on four days; the amount measured was 0.43 inch.

ENGLAND: Temperature.—During the week ending Saturday, June 12, the highest temperatures of the air observed by day were above 70° at Leicester, Cambridge, Nottingham, and Liverpool, and below 63½° at Norwich, Bradford, and Leeds; the mean value from all stations was 67¼°. The lowest temperatures of the air observed by night were below 39° at Truro, Leicester, Cambridge, Wolverhampton, Nottingham, and Hull; and above 43° at Brighton and Norwich; the mean from all places was 39¼°. The extreme range of temperature in the week was above 32° at Leicester and Nottingham, and below 21½° at Brighton and Norwich; the mean range of temperature from all stations was 27½°.

The mean of the seven high day temperatures was above 63° at Plymouth, London, Leicester, Cambridge, and Nottingham, and below 60° at Wolverhampton, Liverpool, and Bradford; the general mean from all places was 62°. The mean of the seven low night temperatures was below 44° at Leicester, Cambridge, Wolverhampton, Nottingham, Sheffield, Hull, and Leeds, and above 47° at Brighton and Norwich; the mean value from all stations was 44½°. The mean daily range of temperature in the week was above 23° at Cambridge and Nottingham, and below 13° at Norwich and Liverpool; the mean daily range of temperature from all places was 17½°.

The mean temperature of the air for the week from all stations was 51½°, being 4½° lower than the value for the corresponding week in 1879. The mean temperature was above 53° at Plymouth, Brighton, Cambridge, and Nottingham, and below 50° at Wolverhampton and Bradford.

Rain.—The amounts of rain measured varied from 0.99 inch at Nottingham, 0.85 inch at Norwich, and 0.80 inch at Liverpool, to 0.12 inch at Plymouth, and 0.22 inch at Brighton; the average fall over the country was half an inch.

The weather during the week was generally fine, though cold and frequently showery.

Slight thunderstorms occurred at places on the 9th, 10th, and 11th inst.

SCOTLAND: Temperature.—During the week ending Saturday, June 12, the highest temperatures of the air observed by day varied from 69½° at Edinburgh to 57¼° at Aberdeen; the mean value from all places was 64¼°. The lowest temperatures of the air observed by night varied from 32° at Paisley to 41° at Greenock. The mean from all stations was 35°. The mean range of temperature from all places was 29¼°.

The mean temperature of the air for the week from all stations was 51°, being 2° lower than the value for the corresponding week in 1879. The highest was 52½° at Glasgow, and the lowest, 49¼°, at both Aberdeen and Paisley.

Rain.—The heaviest falls of rain were at Aberdeen, 1.26 inch, and at Edinburgh, 0.57 inch; and the least falls at Paisley, 0.22 inch, and Dundee, 0.25 inch. The average fall over the country was 0.31 inch.

JAMES GLAISHER, F.R.S.

Enquiries.

He that questioneth much shall learn much.—BACON.

GRASS-CUTTING MACHINES.—Will any of your numerous readers inform me if there is such a machine in the market as can be successfully used for cutting short grass? I do not mean the revolving machine, as it only does for extra close cutting, and when the operation is repeated every ten days or so; but what I am in quest of is one upon the principle of the common corn-reaper and hay-cutter, but with this difference, that it cuts closer than for ordinary agricultural work. My grass is only cut two, three, or four times a year, and sometimes it is pretty rank before I get to it, and sometimes not so. By these indications I trust any one may know what is wanted, and a reply through the medium of your paper will suffice. I would, of course, like to know as full particulars as possible, both as to how the work is accomplished, where the machines have been in use, and something of the cost, &c. A. P. R.

Answers to Correspondents.

ANCHUSA AND CYNOGLOSSUM: J. D. H. Apart from habit, the chief difference is that the nuts of Anchusa are rough, with little bluntish warts, whereas in Cynoglossum they are studded with little hooks.

CAMPANULA CARPATICA: T. D. H. This has the lower leaves on long stalks, and glabrous; the calyxlobes are toothed, the flowers bell-shaped. C. turbinata is more or less hairy, the leaves shortly stalked, not so deeply toothed as in carpatica, the flowers much larger and more bowl-shaped than bell-shaped. C. muralis and C. Portenschlagiana are synonyms, or slight variations only. C. pusilla and C. pumila are both synonyms of C. cespitosa, according to some writers.

CARROTS: J. C. You can do nothing until the crop is off the ground.

CHINESE JUNIPER BERRIES: Camjee. The berries sent are immature, and quite useless for the purpose of propagation. They are possibly falling through drought, or perhaps owing to the past bad season. If any grow on to maturity, sow them in pots of loamy soil as soon as ripe, and keep them in a cold frame till they germinate.

DAVIDSON'S COMPOSITION FOR PROTECTING TREES FROM RABBITS: H. K. The manufacturers are Messrs. Davidson, Oil and Colour Works, Leith.

ERRATA: MR. DAY'S ORCHIDS.—For "fair plants," at col. b, p. 742, read "air plants;" and further down, for "American," read "Australian;" and at col. c, half-way down, for "young roots," read "shoots." J. A.—At p. 745, fig. 123, for "Dracena" read "Dieffenbachia."

INSECTS: H. & McC. The common caterpillar, whatever you may mean by that, has not yet arrived.—G. H. The steel-black insect found on the Goose-grass is the larva of the Bloody-nosed Beetle (Limarcha tenebriosa, L. O. H.—G. G. B. The insect sent is the destructive Hyllobius abietis, a weevil injurious in Fir plantations. I. O. H.—H. H. The little white worms which roll themselves into a ball, and which eat the young Mignonette leaves, were so much dried up and shrivelled that we cannot determine them. They, however, seem to be the larvae of some small weevil. I. O. H.

LINDELOFLIA: J. D. H. This differs from Cynoglossum in the longer tube to the corolla, and in the longer and projecting stamens.

NAMES OF PLANTS: Ward & Co. Anthyllis Vulneraria.—J. Reeves. Chrysanthemum coronarium.—J. Wright. 1, Galega officinalis, white var.; 2, Sedum Sieboldii; 3, 4, next week.—J. C. Lepidium Draba.—T. Davies. A hybrid Aquilegia, perhaps between A. vulgaris and A. chrysantha.—F. C. Jambosa vulgaris, the Rose Apple, probably, and Combretum coccineum.—S. B. 1, Bletia verecunda; 2, Cattleya, a hybrid, perhaps C. Warszewiczii; 3, Doodia aspera; 4, Polypodium plesiosorum.—X. Y. Z. Send a better specimen, properly packed.—Camjee. St. Bruno's Lily (Anthericum liliastrum).—H. V. Your climbing plant is Aristolochia Siphocampylus.—J. B. F. Melica natans.—J. H., Bath. Catasetum tridentatum.—F. S. W. Sedum acre, and Pyrethrum Tethi. hatchewii.—T. B. Stanhopea tigrina; Arctodes odoratum, so far as we can judge from the materials sent.

SOIL: C. H. E. We have not means of testing the loam for iron, but the nearest chemist would answer the question for you, sufficiently for your purpose, at a small cost. It seems to be a most unsuitable soil for growing anything in.

VINE-LEAF: A. B. The leaf appears to have been caught by the sun while wet either with dewdrops or by means of syringing; possibly ventilation had not been attended to sufficiently early in the morning.

VINES: A. R. C. 1. The plan adopted by your gardener will neither do the fruit good nor strengthen the Vines. If the wood is fairly strong, and the foliage ample, the Vines should have been stopped at the third or fourth leaf beyond the bunch, and all laterals kept pinched back to the first leaf. 2. We should prefer to cut them down low, but much depends upon the time selected for planting and the quality of the canes.

COMMUNICATIONS RECEIVED.—W. G. S.—H. G. (you have not guaranteed the good faith of your criticism by giving your name and address).—I. C. N. (many thanks).—W. T.—F. J. D.—F. & P.—M. P. W.—T. S.—J. H. M. (enclosure with thanks).—D. O.—J. R. J.—J. W.—A. C. R.—A. O.—I. R.—G. N.—H. G.—E. C.—Aib. M.—G. A. B.—C. S.—J. C.—E. W. F.—C. Y. M.—G. T.—A. R.—A. B.—Almanac (next week).

Markets.

COVENT GARDEN, June 17.

Business remains much the same as last week, with prices generally lower. James Webber, Wholesale Apple Market.

FRUIT.—RETAIL PRICES.

Table with 4 columns: Fruit name, s. d. s. d., and price. Includes Apricots, Cherries, Cob Nuts, Gooseberries, Grapes, Lemons, Melons, Oranges, Peaches, Pine-apples, Strawberries.

VEGETABLES.—RETAIL PRICES.

Table with 4 columns: Vegetable name, s. d. s. d., and price. Includes Asparagus, Beans, Beet, Cabbages, Carrots, Cauliflowers, Celery, Chilis, Cucumbers, Endive, Garlic, Herbs, Horse Radish, Lettuce, Mmt, Mushrooms, Onions, Parsley, Peas, Potatoes, Radishes, Small salad, Spinach, Tomatoes, Turnips.

New Potatoes:—Jersey Kidney, 15s. to 12s. per cwt.; Round, 9s. to 10s.; French Round, 8s. to 9s.

PLANTS IN POTS.—WHOLESALE PRICES.

Table with 4 columns: Plant name, s. d. s. d., and price. Includes Arum Lilies, Bedding Plants, Begonias, Bouvardias, Calceolaria, Cyperus, Dracena terminalis, Erica, Euonymus, Ferns, Ficus, Foliage Plants, Furcias, Hydrangea, Lilium, Lobelia, Mignonette, Musk, Myrtles, Nasturtiums, Pelargoniums, Pelargoniums, Primula, Roses, Spiraea, Stocks.

CUT FLOWERS.—WHOLESALE PRICES.

Table with 4 columns: Flower name, s. d. s. d., and price. Includes Abutilon, Anemone, Arum Lilies, Azalea, Bouvardias, Calceolaria, Carnations, Cornflower, Eucharis, Forget-me-not, Gardenias, Heliotropes, Lily of the Valley, Mignonette, Pansies, Pelargoniums, Primula, Ranunculus, Roses, Spiraea, Stephanotis, Tropaeolum, Tullothers, Wallflowers.

SEEDS.

LONDON: June 16.—No new feature has presented itself in connection with the trade for farm seeds, and in the almost total absence of business values exhibit no alteration. With a slight concession in prices there would be no difficulty in moving American red, but at present limits nothing can be done. White Clover and Alsike are quiet; there is some inquiry for Trefoil, which is very firmly held. The demand for Mustard and Rape seed continues brisk, though rain is still wanted in some parts of the country before the land can be got into working order. Canary and Hemp are quiet. Blue Peas and Haricot Beans are still selling freely. Linseed is rather cheaper. John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.

CATTLE.

At the Metropolitan Market on Monday trade in beasts was excessively dull, but choicest kinds being scarce were not much lower. There was a fair supply of sheep; the demand was smaller and prices not quite so good as on the previous Monday; it was very difficult to effect a clearance at our quotations. Trade was very dull for lambs, without much alteration in price. Quotations:—Beasts, 4s. 4d. to 5s., and 5s. 4d. to 6s. 2d.; calves, 5s. 6d. to 6s. 8d.; sheep, 5s. to 5s. 6d., and 6s. 2d. to 6s. 10d.; lambs, 6s. 8d. to 7s. 10d.; pigs, 4s. 6d. to 5s. 6d.—Thursday's trade was quiet, and supplies were about the average. Beasts were dull and values drooping, but those for sheep and lambs were firm, and tending upwards. Calves and pigs were quiet, on former terms.

POTATOS.

The Borough and Spitalfields Markets reports state that supplies have been pretty good, and the markets remain quiet at wholesale rates:—Champions, 100s. to 120s. per ton; Victorias, 100s. to 120s.; German reds, 3s. to 5s. per bag; New Lisbon, 8s. 6d. to 10s. 6d. per cwt.; Malta ditto, 8s. 6d. to 10s.; New Jersey kidneys, 14s. 6d. to 17s.—During last week 16,771 packages of new produce were received at London from Lisbon, 3663 packages and 199 bags from Malta.

COALS.

The following are the prices current at market during the week:—East Wylam, 15s.; Percy West Hartley, 13s. 9d.; Walls End—Hetton, 15s. and 15s. 6d.; Hetton Lyons, 14s.; Lambton, 15s.; Original Hartlepool, 15s. 6d.; Wear, 14s.; Tunstall, 14s.; Chilton Tees, 15s. 3d.; Thornley, 15s.; South Hetton, 15s. 6d.; Hawthorns, 14s. 3d.; Radford Navigation, 15s. 9d.

Government Stock.—The closing price of Consols on Monday was, for delivery, 98½ to 98½, and for the account, 98½ to 98½ (both ex div.) The figures on Tuesday and Wednesday were, for delivery, 98½ to 98½, and for the account 98½ to 98½ (both ex div.); and the same prices closed business on Thursday.

**FISHER, CLARK and CO.**, Boston

**THE "ACME" LABELS** (REGISTERED).

Highly commended by all the Gardening Papers.  
**Specimens and Price List on application.**  
**SOLE MANUFACTURERS,**  
**STEVENS & PINCHES,**  
48, LEICESTER SQUARE, W.C., and 27, OXENDON STREET, S.W.

**HILL and SMITH'S BLACK VARNISH**, for Preserving Ironwork, Wood, or Stone. (Registered Trade Mark.)

This VARNISH is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the advertiser, and its genuine good quality, notwithstanding a host of unprincipled imitators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requires no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, Kew Gardens, and at the seats of many hundreds of the Nobility and Gentry, from whom the most flattering testimonials have been received.  
Sold in casks of about 30 gallons each, at 1s. 6d. per gallon at the Manufactory, or 1s. 8d. per gallon carriage paid to any Station in the Kingdom.

**UNSOLICITED TESTIMONIAL.**  
"Pierrefield Park, June 21, 1876.—Sirs,—I have this day forwarded from Chestow to your address a black varnish cask, to be filled and returned with as good Varnish as the last we had, which I candidly admit was the best we ever had. Address Varnish to Pierrefield Park, Chestow.—I am, Sirs, yours respectfully, WM. COX."

**CAUTION.**—HILL & SMITH would particularly warn their Customers against the various cheap Varnishes now so much advertised.  
H & S's Varnish has been an article of common use on most of the large estates in the kingdom for upwards of thirty years; and their constantly increasing trade in it, and the numerous Testimonials they receive, stamp it as a truly genuine article. Every cask is legibly marked with their name and Registered Trade Mark as above, without which none is genuine.  
Large Illustrated CATALOGUE of Fencing, Hurdles, Field and Entrance Gates, &c., sent free on application to  
**HILL and SMITH**, Brierley Hill Ironworks, Staffordshire; 118, Queen Victoria Street, London, E.C.; and 120, Buchanan Street, Glasgow.

By Royal Letters Patent.  
**RITCHIE'S GAS LIGHTING and HEATING APPARATUS.**

No Flue required. Specially adapted for Drying Newly-built Houses. Silver Medal awarded in 1878 at Wolverhampton Exhibition. The deleterious and unpleasant vapours arising from the burning of ordinary coal gas are prevented from escaping, and are made to circulate within the Apparatus or Stove in such a way that they become thoroughly condensed, and are carried off in the form of a liquid, in which will be found the sulphur and other poisons which are drawn from and would in the ordinary way be left in and mixed with the surrounding atmosphere; consequently health is not prejudicially affected, Works of Art, Plants, Pictures, Books, Furniture, &c., are not injured, and the atmosphere is rendered uncontaminated and perfectly healthy.  
Prices from 50s. to £10 10s.

Full particulars and testimonials forwarded on application to **RITCHIE and CO.**, 23, St. Swithin's Lane, London, E.C.

**REDUCED PRICES.**

## HELLIWELL'S PATENT SYSTEM of IMPERISHABLE GLAZING WITHOUT PUTTY, INDIARUBBER, or CEMENT.

It is adopted by H.R.H. the Prince of Wales.  
Highest Award at Fine Art Exhibition, York.

No outside painting required, and it is easily repaired by even inexperienced workmen.

"Bank Chambers, Norwich, October 24, 1879.

"T. W. Helliwell, Esq., Brighouse.—Sir,—I went yesterday and examined the Glass Roof Glazed by you, under my directions, at Sandringham, for His Royal Highness the Prince of Wales, and found it perfectly satisfactory in all respects. The appearance is vastly superior to the old system of wood and putty, and I shall be glad to recommend it whenever I can.—Believe me, yours faithfully,

"C. SMEDLEY BECK, Architect."

T. W. HELLIWELL, Brighouse, Yorkshire, and 19, Parliament Street, LONDON, W.C.

ESTATE CARPENTER, ESTATE STEWARD, or Permanent CLERK of WORKS, or such similar appointment.—A Builder (Carpenter and Joiner by trade), who is about giving up business, desires a situation as above. Could assist in Choir of Church or Chapel. Good testimonials and references.—T., Cadogan Library, 283, King's Road, Chelsea, S.W.

EPPS'S COCOA. GRATEFUL AND COMFORTING. "By a thorough knowledge of the natural laws which govern the operation of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast tables with a delicately-flavoured beverage which may save us many heavy doctor's bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly-nourished frame."—Civil Service Gazette.

JAMES EPPS AND CO., HOMEOPATHIC CHEMISTS. KINAHAN'S LL WHISKY. Pure, Mild and Mellow, Delicious and Most Wholesome. Universally recommended by the Profession. The Cream of Old Irish Whiskies. KINAHAN'S LL WHISKY. Dr. Hassall says—"Soft and Mellow, Pure, well Matured, and of very excellent quality." KINAHAN'S LL WHISKY. Gold Medal, Paris Exhibition, 1878; Dublin Exhibition, 1865, the Gold Medal.—20, Great Titchfield Street, London, W.

"Facts Speak Louder than Words." The Chemist and Druggist says:—"Mr. Saville has sent for our inspection a large bundle of testimonials; he has received from persons who have obtained the desired results, after using his preparation. We confess that, testimonial-hardened as we are, we could not help feeling convinced, from THEIR EVIDENTLY GENUINE CHARACTER, that Saville's Capillary Germinator has really a decided effect when the hair is falling or fallen off."

The following is a fair specimen of the letters we are daily receiving, which prove the good qualities of

"SAVILLE'S CAPILLARY GERMINATOR"

As a Real Producer of WHISKERS, MOUSTACHES, EYEBROWS, &c., And as a Complete and Certain Cure for BALDNESS, Or for Weak, Thin, and Falling Hair.

New Chester Road, Tranmere, Cheshire, April 30, 1880. "Dear Sir,—Will you kindly forward me another bottle of your "Capillary Germinator," as I have found it to be beneficial and quite capable of producing what I so earnestly desired. I shall recommend this wonderful producer to all my friends and comrades. I shall be in London soon, and shall have the pleasure of showing you my capital Whiskers and Moustaches, which your preparation has to my satisfaction produced.—I remain, yours respectfully, "W. C. MAGER."

Harmless, free from grease, nicely scented, will not stain nor injure the skin. The original of the above, with hundreds of similar letters, may be seen at any time.

Full particulars with forty testimonials sent free to any address. Of all Chemists, Perfumers, &c. Sent, carriage paid, to any address, securely packed, with testimonials, directions for use, &c., for 2s. 6d. Larger sizes, FREE, 5s., 9s., and 12s.

JOHN F. SAVILLE AND SONS, 146, Regent's Park Road, London, N.W.

Beware! Beware!!—Every genuine bottle has above title impressed in the glass. Do not be deceived into buying any imitations of this thoroughly reliable article.

WHAT PRODUCES HAIR?

"We are glad to be able to announce that an answer has been found to this long puzzling and perplexing of questions in Warde's Capillare, which, however, turns out not to be a 'new discovery,' but one that has been in use in the practice of a physician of eminence for many years... and so successfully as to produce many beautiful growths of hair, as also whiskers and moustaches in abundance. The secret of its preparation has been purchased by Messrs. Warde & Co., and these gentlemen are giving to society at large what, until lately, has been confined to a limited circle—A REAL HAIR PRODUCER."—Civil Service Gazette.

A beautiful Head of Hair, Whiskers, Moustaches and Eyebrows positively produced by the use of WARDE'S CAPILLARE (The only "Comme il faut" Hair Producer).

(After a course of Warde's Capillare). It preserves the natural colour of the hair; KEEPS IT FROM THINNING; is a SPECIFIC for PREMATURE BALDNESS; and thoroughly eradicates scruff and dandruff. Its fragrance and purity, moreover, recommend it FOR DAILY USE, as the best dressing for the Capillature.

Not genuine without Warde & Co.'s signature on the label, thus Warde & Co. Beware of those who copy the style of our Advertisements, and then "Caution" you that theirs have been so treated. Directions for use with each bottle.

Price, 2s. 6d. per bottle, three bottles 6s. 6d., Privately packed, carriage paid. Can be obtained from all Chemists, per order on Wholesale Houses; or sent under cover, upon receipt of remittance, by G. WARDE & CO., 16, GT. MARLBRO' ST., LONDON, W.

DINNEFORD'S MAGNESIA.

The Medical Profession for over Forty Years have approved of this pure solution as the Best Remedy for ACIDITY OF THE STOMACH, HEARTBURN, HEADACHE, GOUT, and INDIGESTION, and as the safest Aperient for Delicate Constitutions, Ladies, Children, and Infants.

DINNEFORD'S MAGNESIA.

HOLLOWAY'S OINTMENT and PILLS.—FEMALE COMPLAINTS.—On the mothers of England devolve much and serious responsibility in securing for their daughters robust health; frequently, alas! thoughtlessly sacrificed by culpable bashfulness at a particular period of life, when all-important changes take place in the female constitution, upon the management of which depends future happiness or misery. Holloway's Pills, especially if aided with the Ointment, have the happiest effect in establishing those functions upon the performance of which health and even life itself depend. Mother and daughter may safely use these powerful doctstruent remedies without consulting any one. Universally adopted as the one grand remedy for female complaints, these Pills never fail, never weaken the system, and always bring about the desired result.

SEND FOR A PRICE LIST OF

# JOHN BLAKE'S PATENT SELF-ACTING HYDRAULIC RAMS,

*For Raising Water for the Supply of Towns, Villages, Irrigation, Railway Stations, Mansions, Fountains, Farms.*

No Cost for Motive-Power, which is obtained from the Stream of Water passing through the Rams.

No Oiling or Packing Required.

Made in sizes to raise from 300 to 500,000 Gallons per day.

This Advertisement will appear again on July 10

This Ram for small working falls.

This Ram will force a part of the same water that works it, or will force clean water from a well or spring whilst worked by a stream of impure water. Rams on this principle can be supplied to force to a height of 1500 feet.

This Advertisement will appear again on July 10

This Ram, for deep working falls, will force up one-third of the water passing through it

*Parties requiring a Water Supply should not too readily conclude that the quantity and fall of water, if any is available, is too small to work a Ram before consulting J. B.*

## TESTIMONIALS.

From the Right Honourable the EARL of GRANARD, *Castle Forbes, March 1, 1880.*—"The Hydraulic Ram erected for me at Castle Forbes has answered perfectly. Considering the very small fall attainable by the nature of the ground, it is a great success, and throws up water to a cistern on the top of a tower 80 feet high. When Mr. Blake first proposed to put it up I doubted the possibility of its succeeding, owing to the nature of the ground, but I have been most agreeably undeceived."

From Col. TREMAYNE, *Ferran-ar-Worthel, Cornwall, March 7, 1880.*—"The Self-acting Hydraulic Ram you erected here about two years ago is, I am pleased to say, working most satisfactorily, sending up water at the rate of 8000 gallons to a height of 185 feet, and a distance of more than 2000 yards. The quantity of water is as much as you undertook to deliver."

From W. SCARTH, Esq, *Agent to His Grace the Duke of Cleveland.*—"Raby Castle, Darlington, July 16, 1878.—The Hydraulic Ram you supplied to his Grace the Duke of Cleveland in 1875 is a complete success. It worked for more than two years without once stopping, and throws more water than promised."

From JOHN TAYLOR, Esq, *The Rocks, Bath, August 22, 1878.*—"The Self-acting Hydraulic Ram you fixed here in March of last year continues to work well. It has only the same quantity of water and fall to work it as the water-wheel and pump which I used previously to force a height of 204 feet, and yet the Ram sends up more than double the quantity of water that the wheel did to the same height."

From Major STARKIE, *Lovely Hall, Blackburn, May 13, 1878.*—"Sir, I have great pleasure in testifying to the good qualities possessed by the Ram you erected here last year. It has done its work well, and not failed as the other Ram did, which was of a different construction, and supplied by a different firm. I consider that there are great difficulties to contend with here, but your practical mechanical knowledge, both as to the construction of the Ram and its situation here, overcame most of the difficulties that we had to contend against."

From JOHN PENNINGTON, Esq, *Emmott Hall, near Colne, December 21, 1868.*—"Sir.—The Self-acting Hydraulic Ram you supplied me with nine months ago continues in excellent condition. It receives water from a spring through a 2-inch pipe, of which it forces 3600 gallons per day of twenty-four hours to a height of 90 feet, exceeding all you promised, and far surpassing the water-wheel and force-pumps which it has displaced. Its cost is small, it occupies but little space (2 square feet), and in mechanical detail is simplicity itself. I have much pleasure in recommending it as a cheap and efficient method of raising water."

This view represents one Ram worked by water from a spring, and forcing it up to a Farm, Cattle Troughs, Kitchen Garden, and Mansion, all at different elevations, the highest being 444 feet, and to a distance of 2008 yards.

From the Right Hon. T. SOTHERON-ESTCOURT, *Estcourt Park, Gloucestershire, September 6, 1875.*—"You will be glad to hear, as I am to tell you, that your Self-acting Hydraulic Ram has worked exceedingly well and continuously since it was erected, more than twelve months ago. It is, in fact, perfectly successful." (The delivery pipe in the above case is 4200 feet long, with 100 feet rise.)

Dearwater, *Wimslow, November 27, 1873.*—"Dear Sir,—In answer to your inquiries respecting the Hydraulic Ram you supplied me with six months ago, I beg to state that I am more than satisfied with it, as it is in perfect order, sending up to the top of the house about 2000 gallons of water in the twenty-four hours, whereas you only contracted to deliver in that time 500 gallons. I have, therefore, every reason to be well pleased with your work, and more especially as I had a Ram supplied me by another maker which could not send up a single gallon of water to the height required, and a second maker informed me that no Ram with a fall of 3 feet could send up water to the distance required—namely, 120 feet. But yours is an accomplished fact, and does its work most effectually.—Yours, &c., L. HANMER."

From Mr. THOMAS MASON, *Alkincoates Hall, Colne, September 30, 1871.*—"Sir,—Your Self-acting Hydraulic Ram gives me entire satisfaction: it has been at work about fifteen months, and has only been seen once during the last six months; it is forcing about 1400 gallons per day of twenty-four hours, to a height of 194 feet."

## TESTIMONIALS.

From Capt. GANDY, *Castle Bank, Appleby, February 11, 1880.*—"The Self-acting Hydraulic Ram you erected for me is an excellent example of strength and good workmanship. Whilst working with 3 feet 4 inches fall it forces water 73 feet high, and so far gives me every satisfaction. It will do more work in one day than the old Ram of another make could do in a week."

From JOHN WALKER, Esq., *Mount St. John, Thirsk, February 13, 1880.*—"In reply to your enquiry I am glad to inform you that the Hydraulic Ram you fixed here in May last has fully answered my expectations, and your promises as to the quantity of water it would force to a height of 185 feet. I consider it a very good machine, and superior to one I had in use previously."

From Captain TOWNSEND, *Wineham, February 10, 1877.*—"In answer to your inquiry, I am glad to say the Hydraulic Ram you sent me in November, 1875, is working exceedingly well and gives no trouble. It will work when quite immersed, as it has been several times during the floods this winter, forcing up water through a delivery pipe, 900 yards long, at the rate of 80,000 gallons per day, although you only promised 50,000."

JOHN BLAKE, ENGINEER, ACCRINGTON, LANCASHIRE.

SALES BY AUCTION.

Established Orchids, &c.

MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on WEDNESDAY, July 7, at half-past 12 o'clock precisely, the valuable COLLECTION of ESTABLISHED ORCHIDS, formed by the late W. S. Cooper, Esq., of Hill-Morton, Paddock, including some very fine specimens of Phalenopsis, Aerides, Odontoglossums, Masdevallias, Vandas, Angraecums, Cymbidiums, &c., many of them in flower; an importation of PALM SEEDS from Columbia; a collection of fine specimen FERNS and STOVE PLANTS; 20 fine plants of MASDEVALLIA HARRVANA in flower; 2 magnificent specimens of ANTHURUM SCHERZERIANUM; 200 plants of SAXIFRAGA WALLACEI; a consignment of TREE FERNS and other Plants from New Zealand; ORCHID BASKETS, &c.; and several other importations of ORCHIDS, PALM SEEDS, &c.

May be viewed the morning of Sale, and Catalogues had.

Oncidium lanceanum.

MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY, July 8, at half-past 12 o'clock precisely, by order of Mr. F. Sander, St. Albans, a splendid importation of ONCIDIUM LANCEANUM, in large masses and splendid condition. Among others the consignment contains the most wonderful mass that ever reached this land, measuring 14 feet in circumference, and consisting of a group of plants growing closely on part of a tree. Four natives carried this truly grand specimen four weeks on poles to the seaport.

May be viewed the morning of Sale, and Catalogues had.

Acton, W.

EXPIRATION OF LEASE.—CLEARANCE SALE. MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, on the Premises, The Nursery, Park Road, Acton, W., near the Station, on FRIDAY, July 9, at 12 o'clock precisely, by order of Mr. Long, without reserve, the whole of the well-grown STOVE and GREENHOUSE PLANTS, including fine Ficus elastica, Bouvardias, Maidenhair Ferns, Lycopods, 1000 Double White Primulas, specimen White Azaleas, Scarlet Geraniums, Fuchsias, and Callas, two Market VANS, capital Spring CART, and other effects.

May be viewed. Catalogues had on the Premises and of the Auctioneers, 98, Gracechurch Street, E.C., and Leytonstone, E.

Near the Victoria Station, Manchester.

AUCTION SALE OF IRON ROOFS, BUILDINGS, WIRE FENCING, &c.

MR. CHARLES COSTIGAN will SELL by AUCTION, on TUESDAY, WEDNESDAY and THURSDAY, July 6, 7 and 8, near Victoria Station, Manchester, on vacant land, corner of Victoria and Chapel Streets, about 260 tons of valuable IRON and STEEL MANUFACTURES, including about 20,000 Galvanized Corrugated Iron and Steel Roofing Sheets, painted and black corrugated sheets; 60 Complete Iron and Steel Roofs, 40 Complete Iron Buildings, 12 miles strong Wire Cattle Fencing, large quantities of Iron Hurdles, Gates, Fencing, Rope and Standards; Eaves Gutter, Ridge Capping, &c. The Galvanized Corrugated Iron and Steel Sheets will consist of usual sizes and strengths, suitable for covering roofs and buildings for all purposes. The Complete Roofs are valuable for hay and corn sheds, and general agricultural and manufacturing shedding, stores, warehouses, workshops, &c. The Wire Fencing is of various strengths, most of it against heavy cattle. The Hurdles are of three strengths, extra heavy, strong, and medium. All the goods are new, of usual sizes and best manufacture, and will be put up in convenient lots to suit all buyers. The Iron Roofs are particularly worth the attention of agriculturists: thousands are now in use throughout the kingdom for hay and corn barns, &c. Save their cost to farmers in about three years. Catalogues may be had a week before Sale, from Mr. COSTIGAN, Auctioneer, Park Road, Liverpool; and ISAAC DIXON, Windsor Ironworks, Liverpool. Full particulars may be had from Mr. DIXON. Goods may be viewed on Monday, July 5.

Hemel Hempstead (4967).

Carriage paid, London or Reading, or 30 miles. N.B. Lower quotation for larger quantities. Apply, EDWARD LEIGH, Norcote Farm, near Guildford.

HELLEBORUS NIGER, the Christmas Rose. This beautiful white flower, coming to perfection at Christmas time, is already much too little grown, being hitherto too scarce and dear. Millions of its fine blossoms should be ready for the markets in mid-winter, where only hundreds are now to be found, and would always prove the most profitable thing it is possible to grow. It requires no heat nor care. We are prepared to supply for immediate orders any quantity of fine roots at one-sixth the usual prices, and we believe that investment in them will prove the finest speculation possible. For terms apply to HOOPER AND CO., Covent Garden, London, W.C.

CAULIFLOWER and CABBAGE PLANTS.

Our own selected stocks, in good strong plants. Veitch's Autumn Giant Cauliflower, per 1000, 7s. 6d.; Walcheren and Early London Cauliflower, per 1000, 6s.; Brussels Sprouts, per 1000, 5s.; Daniel's Defiance Cabbage, per 100, 1s., per 1000, 7s. 6d.; Enfield Market, Early Nonpareil, and extra, per 1000, 5s.; Champion Drumhead or Cattle Cabbage, extra fine stock, per 1000, 4s. 6d.

Free on Rail at prices quoted. Orders of 20s. and upwards carriage free. DANIELS BROTHERS, The Royal Norfolk Seed Establishment, Norwich.

TOTTENHAM NURSERIES,  
Dedemsvaart, near Zwolle, Netherlands.

**DANIELS' Unrivalled Strains of Choice FLORISTS' FLOWER SEEDS.**

Post-free.  Post-free.

In the rearing of Florists' Flowers from seed the first essential point is to secure carefully hybridised seed, saved from the finest flowers of the finest kinds, the chances of success in raising some really good varieties being vastly greater from a few plants from seed of the choicest quality, than from a large quantity raised from seed of an inferior description.

**FOR PRESENT SOWING. Per pkt.—s. d.**

- AURICULA, Daniels' Prize Alpine .. .. 1 0
- CARNATION and PICOTEE, from stage flowers, very choice .. .. 2s. 6d. and 5 0

**Unsolicited Testimonials.**

From Mr. R. GALER, *The Gardens, Smallburgh Hall, April 14*.—"I must tell you that my Primulas and Cinerarias from your seed are first-rate, the blue Cinerarias are magnificent."  
From Mr. H. DALLIMORE, *Canton, Cardiff, July 8*.—"The Calceolarias grown from your seeds have turned out splendidly, both as regards colour and variety, and have gained me three 1st prizes."  
From Miss WELCH, *Everreech, February 26*.—"Miss W. has a splendid show of single, double, and Fern-leaved Primulas raised from Messrs. Daniels' seed. They have bloomed since October."  
From N. VYE, Esq., *Uffcombe, July 9*.—"The Picotee seed I had from you succeeded well and produced magnificent flowers."

**DANIELS BROS.,**

The Royal Norfolk Seed Establishment, Norwich.

**IMPORTANT NOTICE.**

**J. CHAMBERS,**  
Westlake Nursery, Isleworth, W.

Is now prepared to send out his two new Hybrid Bulbous BEGONIAS, ROYAL STANDARD and AVALANCHE, in nice healthy little plants at 1s. each. They received First-class Certificates, June, 1879, both at South Kensington and Richmond. These are undoubtedly the two grandest Hybrid Begonias ever offered: see *Gardeners' Chronicle*, June 28, 1879. Both varieties can be seen in flower at the nursery.

Also a new White LOBELIA MAGNIFICA ALBA. The habit is identical with that well-known variety magnifica. As a pot plant for general decoration with Lycopodium, Maidenhair, and other small Ferns, I know of nothing to equal it. Nice plants at 1s. 6d. each, or 12s. per dozen.

Usual allowance to the Trade. Terms cash. Post-office Orders payable at Spring Grove, Isleworth, W.

**DANIELS' CHOICE SEEDS FOR PRESENT SOWING.**

POST-FREE.  POST-FREE.

**DANIELS' DEFIANCE CABBAGE.** The most magnificent variety ever sent out, weight 12 to 15 lb., remarkably early, short-legged and compact, and of the most delicious marrow flavour. Should be in every garden. Per packet, 1s. 6d.

**DANIELS' DEFIANCE CABBAGE.**

From Mr. THOS. FORTUNE, *Gardener to Sir Thos. Butler*.—"Last year Daniels' Defiance Cabbage did very well with me. It is very distinct and superior to the old standard varieties."

REMOVED to 43, Commercial Street, London, E.

**HORTICULTURAL WINDOW GLASS,**

15-oz. and 21-oz., in Boxes containing 200 feet, Carriage Paid to any Railway Station in England. Price Lists on application.

**ALFRED SYER,** Glass, Lead, Zinc, Oil and Colour Merchant, 6 and 8, Pentonville Road, London, N.

**BELGIAN GLASS for GREENHOUSES, &c.,**

Can be obtained in all sizes and qualities of **BETHAM & SON,** 9, LOWER THAMES STREET, LONDON, E.C. B. & Son have always a large Stock in London of 20-in. by 12-in., 20-in. by 14-in., 20-in. by 16-in., 20-in. by 18-in., in 16-oz. & 21-oz.

**BOOTE and MILLSON, LEAD and GLASS MERCHANTS,** 64, City Road, E.C., have always on the PREMISES a large Stock of all kinds of Horticultural Glass, at lowest market rates.

By Permission of the Hon. Board of Customs.

(Free of Duty.)

# CORRY & SOPER'S NICOTINE SOAP

(PATENT.)

An effectual and speedy Eradicator of  
Scale, Thrips, Green Fly, Mealy Bug,  
Red Spider, American Blight,  
and all  
Parasites affecting Plants, without  
Injury to Foliage.

*It may be used with perfect safety and efficiency  
for the Destruction of Gooseberry  
Caterpillars.*

**Especially adapted for the Destruction of  
Blight on the Coffee Plant.**

The Proprietors have great pleasure in bringing to the notice of Horticulturists generally this valuable preparation, the basis of which is *Nicotine*, or the Oil of Tobacco, with which is blended other essential ingredients, to render it available as a general INSECTICIDE.

It has now undergone a thorough test by some of the most Practical Men in Horticulture, and it is proved beyond all doubt that no Insecticide will bear comparison to it for killing properties with PERFECT SAFETY TO FOLIAGE.

It may be used as a Dip or Wash for any description of Out or Indoor Plants, and as a Dressing for the Bark of Fruit Trees, Vines, &c., it has no equal.

Some hundreds of Testimonials lately received from men of considerable experience throughout the Kingdom.

Sold in Jars, 8 oz., price 1s. 6d.; 20 oz., price 3s.; and in Tins, 14 lb., price 15s. 6d.; and Drums, 28 lb., price 25s.; 56 lb., price 50s.; 112 lb., 95s. Full directions for use on each package.

And 2 ounce Sample Jars, 6d. each.  
Full directions for use on each package.

Manufacturers of TOBACCO POWDER, TOBACCO JUICE (duty free), TOBACCO PAPER and CLOTH, and HORTICULTURAL SUNDRIESMEN.

May be obtained from all Seedsmen and Florists.  
Wholesale from the Manufacturers,

**CORRY & SOPER,**  
BONDED TOBACCO STORES,  
SHAD THAMES, LONDON S.E.

# CHRYSANTHEMUM ETOILE D'OR.

A splendid Conservatory Plant, blooming profusely all the year;  
flowers excellent for cutting.

Equally adapted for Bedding in the Flower Garden in Summer.

Now being sent out, 24s. and 36s. per dozen, strong plants, in flower and bud.

**W. HOWARD,**  
FLORIST, SOUTHGATE, LONDON, N.  
*Orders to be accompanied by a Cheque or Post-office Order.*

THE Gardeners' Chronicle.

SATURDAY, JUNE 26, 1880.

COVENT GARDEN.

THERE is no place where a gardener or a farmer, or a person from the country, could while away an hour more pleasantly or perhaps more profitably than round about the square that forms the great Covent Garden Market "of a morning" as the cockney will have it. Every inch of space seems to be utilised by a variety of vehicles for holding goods, and so crowded and wedged together are they that despite Mr. Bright's now historical opinion as to the impracticability of driving four omnibuses abreast through Temple Bar, such a feat would not seem too great for these accomplished waggoners. The good humour and banter, too, and the ready chaff that prevail would offer a splendid field for the pen of a Dickens to utilise. It is really wonderful the vast amount of vegetables and fruits, and plants and flowers that are turned over in a comparatively small space, and although there is a Babel of voices there is apparently in the midst of it all a considerable degree of order. Living as I did in the Tavistock Hotel for a couple of weeks, during a business tour, I could not miss seeing and noting much that was new and interesting to me. Nothing in the whole market pleased me better than the decided improvement in the make-up of bouquets. Fashion is imperious, and it seems at present ruling in the right direction, as much of the plum-pudding formality is now ignored and in its place there is an easy graceful putting together of flowers of a variety of form which under the old system had to be left out. No doubt the beauty of many of them is due to a considerable sprinkling of Orchids, and in some of the windows these flowers not only abound, but some of the very best forms of species are there in spikes or racemes or panicles as the case may be—abundantly showing that these beautiful things, in their way, can be had by any city man, or any other man of course who does not keep glasshouses but who can pay for flowers.

A few strides further down, and we come upon Stevens' Rooms, now the most wonderful place possibly for Orchids changing hands in the world. Once upon a time "Stevens' Great Rooms" looked to many, when they peeped in, very little, but there was always a considerable business done in them. Since I knew them—and like every other place that prospers—they have become greater, and means have been taken, not a bit too soon, looking to the number of sales, to increase the temperature when needed by hot water-pipes. This, of course, ensures the safety of tender plants, and owners who mean to dispose of their collections in the winter season are likely to get better prices than if there were any risk as to suffering from cold.

A novice stepping in and seeing a motley assemblage of anything but captivating-looking plants, bringing from five shillings up to a hur-

dred guineas, would deem this a species of purchasing madness, but looking to general results it is not so. Horses and shorthorns and poultry have gone down in price in these dull times, but the best quality Orchids have gone up. This shows a healthy state, and is an encouragement to buyers, sellers, and the trade generally. It is one of the best evidences of the march of horticulture, and no one can say but that its tendencies are praiseworthy and that it is a pastime to the opulent of the most delectable kind. In all our horticultural establishments there is a great deal of labour in getting the Orchids into first-rate condition, and we can scarce help envying Mr. Stevens, for the quiet and efficient manner in which he gets through his part. Here is a lot of established Orchids, and consigned from the vans to "Charles" and his assistants for arrangement according to numbers. A few hours' work and they are all arranged for moving to the little table in front of the rostrum. Taking a bird's-eye view of them before they are deposited they do not look much, as sale arrangement and arrangement at home are two different things. A few gentlemen and gardeners busy themselves inspecting the lots individually, noting down what plants they want, and so on. The sale rooms, unlike many others, are seldom if ever crowded, but most of the people that frequent them are buyers. The work proceeds and is finished, and in a few hours the room is cleared ready for next day's work—no matter whether it has been £200 or £1000 worth that has been sold. Some proceed to pack their purchases with great care; others unceremoniously turn them out of pots, and into a valise or box, and go off with possibly £100 worth of goods, and in many cases without the slightest injury. This sort of thing was going on nearly every day during my stay in the metropolis, and it seems to be going on at a greater ratio every year. There appears no glutting of the market, as the love for Orchids among those who can buy them seems fully as great as the supply, however extraordinary it may and does appear to us all. *J. A.*

## New Garden Plants.

ANGRÆCUM CHRISTYANUM, *n. sp.*

This is a highly curious *Angræcum*, it having a single caudicle. The general aspect is something like that of *Angræcum arcuatum* (*Listrostachys arcuata*). The dimensions of the stems and leaves are much alike. The rachis of the inflorescence and the flowers are smaller, the leaves ligulate, standing very close to one another, broader at the base than at the top, nearly 3 inches long by  $\frac{3}{4}$  inch wide at the base, with a two-angled unequal apex. The peduncles are very numerous, standing singly,  $\frac{1}{2}$ — $\frac{3}{4}$  inch, very flexuose, three to four flowered. The flowers have pedicels articulate at the base, as in *Angræcum articulatum*, and are apparently yellow or greenish-white, with triangular acute sepals and petals, a very much developed three-lobed lip extended into a retrorse conical spur which has appended at a right angle another inflated fusiform spur, separated from the superior part by a constricted mouth, a kind of "Foramen Winslowii." There are a few very short velvet hairs. The species was kindly sent by Mr. Thomas Christy, F.L.S., Malvern House, Sydenham, S.E. Half was sent to Hamburgh, half to Dresden, now both are at hand. Mr. T. Christy, F.L.S., appears to be singularly fortunate with *Angræcum*. After having flowered, December 17, 1878, the curious *A. lepidotum*, he now sees at one time this fresh species, to which I have affixed his name, and the old *Angræcum odoratissimum* (*Listrostachys odoratissima*). *H. G. Rehb. f.*

JAMAICA CINCHONA.—We are happy to learn that the prices for Cinchona bark grown in Jamaica are most satisfactory and encouraging, the prices realised being in some cases nearly double that realised by the Indian bark. Ten thousand pounds weight of bark was obtained from 2400 trees, giving an average of a little over 4 lb. weight of dry bark per tree, or an average yield of 17s. per tree. The variety is *C. succubra*.

## GREENLANDS, HENLEY-ON-THAMES.

HENLEY-ON-THAMES, in Oxfordshire, is appropriately described by Mr. Charles Dickens, in his *Dictionary of the Thames*, as "the Mecca of the rowing-man and one of the most favourite places of pilgrimage for anglers; is a comfortable, prosperous-looking town set down in a pleasant valley, almost entirely surrounded by well-wooded heights, and is as good a place to stay at for the tourist who takes no interest either in oars or rods, punts or wager-boats, as can well be desired." Round about this pleasant Oxfordshire town there are several notable houses, such as Park Place, the residence of John Noble, Esq., on the summit of the hill on the Berkshire side; Stonor Park, Henley Park, Phyllis Court, Fawley Court, &c.; indeed the outskirts of the town are remarkable for the number of handsome houses, especially towards the Fair-mile, a very fine avenue of trees which leads from the north of the town. There is much to interest the visitor, and if the weather prove fine, a most delightful holiday can be spent by him.

Greenlands, the Buckinghamshire residence of the Right Hon. W. H. Smith, M.P., is in the parish of Hambleton, a little distance nearer Henley. Greenlands, though to all appearance a modern place, is of some ancient date. In the reign of Elizabeth and later it passed to a younger branch of the Doyley family, who resided here for many years. Lady Periam, wife of Sir Robert Doyley, died here on May 3, 1621. By her will it appears that the house was of great extent and richly furnished. John Doyley, eldest son and heir of Sir Cope Doyley, resided at Greenlands during the commencement of the Great Rebellion, and was firmly attached to the Royal cause; he had the misfortune to have his house converted into a garrison. In 1644 the house underwent a long siege at the hands of the Parliamentary forces under Lord Essex. He was succeeded by General Brown, who planted batteries on the opposite side of the river, which "made many shot and much battered" the house, and almost "beat it about the ears of the garrison." The garrison eventually surrendered to General Brown, but marched out with all the honours of war. Several cannon balls have been dug up about the grounds, but little else in the way of implements of war.

Another account states that Greenland House at the time of the Civil War was the residence of Sir J. Doyley, through whose attachment to the Royal cause it was converted into a garrison and sustained a siege of six months (A.D. 1644), when most of the building having been destroyed, the governor, Colonel Hawkins, capitulated on honourable terms. The house exhibits but few specimens of the former grandeur of the mansion. The fortifications, however, raised during the siege, are yet distinguishable. Between the house and the river skeletons have been found, also skulls, bones, and coins.

In 1852 or 1853 Greenlands was purchased by the late Edward Marjoribanks, Esq. It was then formed out of four estates. When he died it was left to Sir Dudley Coutts Marjoribanks, Bart., and disposed of by Sir Dudley to Mr. Smith in 1872. Mr. Smith has made valuable additions to, and greatly improved the property, which is situated partly in Buckinghamshire and partly in Oxfordshire. The Marjoribanks family also added to the estate, and enhanced its value by good management.

On the Buckinghamshire side is situated the residence, home farm, &c., and on the north are hills crowned with woods, consisting of Oak, Beech in large quantities to supply wood for chair-making, and Larch. In the springtime the wild cherry, covered with its white blossoms, lights up the sombre hues of Beech and Oak ere the buds unfold their leaves, and with the pale shining green of the Larch impart to the woods a peculiarly pleasing expression. There are three main woods—The Pale Wood, the Great Wood, and the Ridge Wood; and on the north side they may be said to describe the bow of an arch from the higher to the lower point of the river, enclosing the main part of the estate within a natural cordon. Within and about these woods there are drives and views of no mean order, and from certain points of the heights the surrounding country is seen to the best advantage. Year after year sees some improvement worked out. From one wooded eminence a broad turfy ride leads down the side to Hambleton Church lying in the valley below, that is richly wooded and watered by the river. It is a

picture of so much beauty that the eye turns from it reluctantly; it is full of that high, sweet influence felt, but incapable of description, like the fragrance breathed from an everlasting spring. Greenlands is situated about 2½ miles from Henley-on-Thames, along what is known as the Hatfield Road. It strikes the visitor as a little odd that the milestones on the road-sides give the distances to Hatfield in Herts, the main road to the historical place being in this direction. Almost as soon as the confines of the estate are reached the mansion is seen on the right of the roadway with the broad glassy sweep of the river stretching away in both directions; and on the left, in a conspicuous position, are the newly erected gardeners' cottage and kitchen garden. Both are in keeping with the place; the former is quite a striking and picturesque erection, making a charming object in the foreground of the landscape. On the right hand is the main entrance to Greenlands house and grounds, a broad sweeping carriage drive leading by umbrageous clumps and lines of shrubs and trees, evergreen subjects and fine specimen Conifers being largely prominent.

The new kitchen garden, made a few years ago, is close to and on the east side of the gardener's cottage. It is in the form of a square surrounded with walls, and is 1½ acre in extent. The walls are substantially built, are 12 feet in height, 13 inches thick, and with the coping at the top projecting some 6 inches. There are a centre and two side walks, the former 9 feet in width to admit of manure being carted in when requisite, with connecting walks at the east and west sides. On the east wall are Plums, showing a fair promise of fruit, the leading varieties being Washington, Jefferson, Victoria, Green Gage, &c.; on the north wall are Morello and Late Duke Cherries. The west wall has Apricots, chiefly Moor Park, planted against it. Against the south wall are Plums and Cherries, and two Peaches, but this fruit does not do well outside, the position being too cold and bleak. It is seven years since the trees were planted, and under Mr. Good's fostering care they have done well, and are now in good bearing condition.

At the back of the wall on the east side is a frame-ground, and against the wall is a border on which were standing groups of *Rhododendron odoratum*, *Kalmia latifolia*, *Skimmia japonica*, *Azalea mollis* in variety, *Daphne Cneorum*, *American Azaleas*, &c., that had come out of the forcing-house, and were now being carefully looked after. Great quantities of cut flowers are required for the London mansion when the family is in town, and constant attention is necessary to maintain a supply. Potatoes, French Beans, &c., were coming on in cold pits. The former were represented by Veitch's improved Ashleaf, planted the first week in January in a bottom-heat formed of 3 to 4 feet of dung, and the latter by Osborn's Forcing, a variety of which Mr. Good speaks very highly. There were six lights of these, the Beans being sown at the end of March or early in April. Altogether there are eighteen lights to the line of frames, and when the Potatoes and French Beans are over they are very useful for Melons.

There is a very useful south wall flanking the high road, and against this are planted Pears, such good sorts as Knight's Monarch, Beurré Diel, Brockworth Park, Ne plus Meuris, and other good sorts. One part of the wall had standard and half-standard trees planted out to give a supply after the Pears are over on the south wall in the garden. In front of this Pear wall is a 5-foot border which is found very useful for Strawberries. North-east of the kitchen garden are the home farm, with the necessary outbuildings, and the dairy, which is one of the most artistic buildings of the character we can remember. Close by are the labourers' cottages, and the construction of these, together with the nice pieces of garden allotted to each dwelling, show Mr. Smith's forethought for the comfort and convenience of those employed on the estate.

Passing from the kitchen garden, across the Hatfield Road, the visitor is conducted to a block of plant-houses, in which there is to be found much of an interesting character. In a spacious span-roofed house in two divisions—the house covering a plot of 117 feet by 30 feet, and running east to west—is a large, varied, and most useful collection of plants. The western division is a warm greenhouse for Palms, Crotons, *Franciscas*, *Ixoras*, the useful *Tabernæmontana*, and indeed a representative collection of stove plants. In the eastern division are numerous fine specimen

Azaleas, and what is known as old-fashioned greenhouse plants. Mr. Good, being an old pupil of the late Mrs. Lawrence, when at Ealing Park, has a great affection for these plants, and finds many of them very useful for cutting from. Among them are good half and three-quarter specimens of *Boronia elatior*, *Tetratheca verticillata*, with its numerous and pretty violet flowers; *Adenandra speciosa*, *Correas*, *Hedromas*, *Dracophyllum gracile*, *Pimeleas*, *Chorozemas*, *Rhododendron Princess Alice*, &c.: all these are handsomely furnished plants, cultivated with great care and judgment. The centre stage is formed of concrete walls, enclosing a huge tank covered with slate, and strewn with powdered shells; round the sides of both divisions is a 3-foot stage, and the walks are broad, roomy, and paved with slate. A great quantity of rain-water can be stored in the tank, and there are dipping places for obtaining water at convenient spots. On the outer stage are small specimens of *Phenocoma prolifera Barnesii*, *Erica elegans*, *Dillwynia splendens*, with its fine and striking orange and brown blossoms; large plants of *Desfontainea speciosa* with their bright looking yellow and red flowers; *Azalea sinensis Fraseri*, with very fine deep yellow blossoms, &c. In constructing this house provision was made for a supply of water in case of prolonged drought, so that should the tank become empty it can be filled from a reservoir on the estate.

By the side of this house is a Peach and Nectarine house the length of the other, and this is planted with the latest varieties possible to procure. Of Peaches there are the Barrington, Late Admirable, Walburton Admirable, and of Nectarines Pine-apple, Rivers' Victoria, and Elruge. This house being only 8 feet in width, with a walk down the middle, is sufficiently heated by means of a flow and return 4-inch pipe; it is also very useful for supplying cut blooms of Roses early in the season, the plants being trained along in the span of the roof, and far enough away from the trees to do them injury. The leading Roses are *Maréchal Niel*, *Gloire de Dijon*, and *Solfaterre*, and they do well close to the glass, coming in before the pot Roses and those in the open air. Ventilation can be given on both sides, by means of sliding lights. This is a very useful house indeed, and the condition of the trees and the good crops of fruit they were carrying testified to the care bestowed on them by Mr. Good.

Next comes a range in three divisions, the western end being used as a Cucumber-house, and used also for Melons in pots. It is also turned to account for the culture of some useful stove plants, such as *Stephanotis floribunda* trained against the roof; *Caladium*, *Clerodendron fallax*, in fine colour; *Scutellaria Mociniana*, *Aphelandras*, &c. Against the wall just within the door was a plant of the pretty white *Rivina tinctoria*, a self-sown plant, that is in flower all the year round, and a most useful subject to cut from. In the other divisions are useful plants that come in handy for furnishing, &c., such as *Gardenias* in pots, *Ixoras*, *Gloxinias*, *Marantas*, *Crotons*, *Eucharis*, *Phyllanthus Lindenii*, &c.

Cucumbers are had nearly all the year round, the avouite varieties being Jones' Empress and Hedsor Winter Prolific, the latter an excellent Cucumber when it can be had true. Here, too, are *Ixoras* in pots, young *Dracenas*, &c.; indeed there is such a large need for plants of this character that they cannot be too numerously grown.

Next is another span-roofed house, also in three divisions, and, like the preceding one, narrow in dimensions but very useful for the purposes to which it is devoted. In two divisions are Orchids. The collection is at present small, but additions are gradually being made. Among those now or lately in bloom are a finely-coloured variety of *Odontoglossum Roezlii*, *Cypripedium niveum*, so useful to cut from; *Dendrobium formosum*, *D. nobile*, *D. crystallinum*, *D. Bensoni*, are fine varieties; *Cypripediums* in variety; small plants generally, but all in good condition. *D. nobile* is most useful for supplying cut flowers. Of cool Orchids, or at least those having cooler treatment than the preceding forms, are *Oncidium macranthum*, *Odontoglossum pulchellum*, *Maxillaria Harrisoni*, *Ada aurantiaca*, *Trichopilia suavis*, &c. In the remaining division were *Pelargoniums* in pots for cutting from, both show and fancy, and other useful subjects.

On the west side, running at a right angle with the plant-houses, but parallel with the potting-sheds, bothies, &c., and shut out from view by hedges, is a row of many lights heated with hot water, and found

very useful indeed for Roses, Cyclamens, Double White and other Primulas, bedding stuff, &c.

Next comes the old kitchen-garden now mainly used as a fruit garden—Gooseberries, Currants, and Strawberries being the principal subjects. This garden is just under an acre in extent, with a range of vineries, &c., against the south wall. On the west wall are Apricots; on the north wall Plums; the east wall is to be replanted in the autumn. Commencing at the east end of the range, the first division is used for Ferns, and on the roof, but occupying only a portion of its former dimensions, is the fine example of *Bougainvillea speciosa* to which attention has already been called in these columns. The centre stage is filled with Ferns, that do well under the grateful shade of the *Bougainvilleas*; there is a wall at the back, with shelves against the wall, and these come in useful for French Beans, Strawberries, &c. Next comes a series of five vineries, one an early house, the other a late house, both with inside borders; the remaining three have outside borders. In the early vinery are Black Hamburg and Buckland Sweetwater, planted alternately, and now in their seventh year, and doing well. Strawberries and French Beans are grown on the shelves here also. In the next division are older Vines, chiefly Muscat of Alexandria and Black Hamburg. In the next house are Madresfield Court, Black Hamburg, Muscat of Alexandria, and Golden Hamburg. Mr. Good warmly praises the Madresfield Court, regarding it as a very fine Grape, and treated in the same way as the Black Hamburg, it comes very fine. In the next house are Hamburgs, West's St. Peters, and Lady Downe's, and, in the latest vinery Alicante and Muscat. President Strawberry is largely grown by Mr. Good for pot-work, and is highly commended by him.

At the back of the vineries is a very useful house for retarding previous to flowering, as well as housing after blooming, plants that are sent to London for the decoration of the town house. Azaleas and such things find here for a time a congenial resting-place; *Rhododendron Nuttalli* has been very fine here, and some excellent *Camellias* in pots find a place.

The south side of the old kitchen garden affords space on the reverse of the wall for a narrow Peach-house, formed of glass placed against the wall after the Trentham plan. This is about 176 feet in length by 5 to 6 feet in width. The first division had early Peaches and Nectarines in a forward state, representing the best standard sorts; the trees in excellent condition. The second division is devoted to the culture of Figs, chiefly Brunswick and Brown Turkey. The third division had Peaches and Nectarines repeated.

From this point access is had to the pleasure grounds surrounding the house, and the spacious sloping lawn in front of it falling away to the river, which washes its verge for some distance. Of specimen trees there are a fine *Catalpa* which blooms freely, a Venetian Sumach, which is very fine in autumn; *Taxodium sempervirens*, &c., and one or two fine Cedars of Lebanon which form conspicuous features. On the lawn are fine beds of the best varieties of hardy *Rhododendrons*; and flower-beds are set down here and there.

Adjoining the mansion on the east side is a fine oblong conservatory with a broad ridge-and-furrow roof. Along the centre of the house are two large beds with fine specimen Palms, Tree Ferns, *Camellias*, &c., either planted out or growing in pots: Azaleas, Agaves, &c. On the back-wall are *Camellias*, and on the roof *Tacsonia Van Volxemi* and other creepers are trained. In the centre of the back wall is a fernery, arranged as an alcove with much skill and taste.

The grounds are by no means deficient in charming features—one in particular is afforded by some archways of Ivy. Behind them is a grove of fine young Elms and other trees, with a grand old Walnut tree forming the background. Further eastward is a raised border planted with many of Robert Fortune's Japanese plants, *Retinosporas* in variety forming a leading feature, and very charming they are when well furnished with foliage. Next comes the rockery, one view of which is seen in our illustration (fig. 142, p. 813). The ground level is sunk below the surrounding surface, and it is constructed of Derbyshire tufa. Ferns, Sedums, Saxifrages, *Yuccas* of dwarf growth, and many things of spring and summer flowering habit are found here in great variety and well intermixed. The rockwork was designed by Mr. Marnock and completed by Mr. Pullman, but improved in many of its features by Mr. Good.

Beyond this lies a further stretch of pleasure-ground, which having been taken in from fields has

been nicely planted, and now lends additional charms to this riverside residence.

After having been in charge of Greenlands for some twenty years, Mr. Good is leaving the service of Mr. Smith. He will always be able to look back with pride on the many touches of added beauty he has so largely assisted to impart to the place. *R. D.*

## PLANT GOSSIP.

HYBRID YUCCAS.—M. Deleuil, of Marseilles, contributes to the *Revue Horticole* an account of the hybrid raised by him and sent out under the name of *Yucca dracænoïdes* ×. This originated between *Y. aloifolia variegata* as the seed parent and *Y. pendula* as the pollen parent. This cross produced 350 plants different from the parents, and very different one from another. One of the most distinct of these seedlings is the plant above cited, and of which a full description is given. The same experimenter fertilised *Y. aloifolia variegata* with the pollen of *Y. albo-spica*. The cross, named *Y. levigata* ×, produced 300 plants intermediate in character between the parents, but all alike, with little or no variation between them. Details of numerous other crosses are given, showing that the *Yuccas* fruit readily at Marseilles, and promise an abundant variety for the gardener. The physiological differences between the species, as above indicated, are very noteworthy, but very difficult to be explained.

—LEWISIA REDIVIVA.—We lately had the pleasure of witnessing a very fine display of this singular and truly beautiful plant in the nurseries of Messrs. James Backhouse & Son, York. The plants were growing in a 4-foot bed, in which a considerable quantity of peat earth had been thoroughly incorporated with the ordinary nursery soil. The plants were fully exposed to full sun-light, and they certainly were remarkably vigorous and fine, in fact the ground was literally covered by the large rosy-pink Cactus-like blossoms, which were nearly 3 inches across. Strange to say, the leaves of this quaint alpine plant, which resembled, a few days ago, a small tuft of Sea-pink, have now entirely disappeared, and will not make their reappearance until about next October. No doubt, owing to this singular habit which the plant possesses, it has not unfrequently been thrown away as dead by cultivators, who should have waited patiently for its reappearance. In its dormant state it is better to keep the plant rather dry.

—RHODODENDRON "SALVINI."—During the last few years many new varieties of hardy hybrid *Rhododendrons* have been sent out in all shades of colour, and as many of these (being the descendants of the same strain of parents) must necessarily bear a close resemblance to each other, it is only when a new variety possesses some exceptional merit that it calls for a special remark. Such a one is *Rhododendron Salvini*, sent out amongst others by Mr. Maurice Young, of Milford Nurseries, near Godalming, some three or four years ago; in colour it is of a rosy purple-lake intensely spotted with chocolate all over the flowers; the foliage is smooth and ovate in shape, and the habit compact. Its chief characteristic is, however, the freedom with which it sets its blooms, nearly every shoot on two or three year old plants having a bud, and sometimes two and three in a cluster; and we saw even grafts of one year carrying single trusses, and this every year. That it is perfectly hardy both in wood and bud is established beyond doubt by the fact that it has passed perfectly unharmed through the past severe winter, which proved so fatal to the buds of many other varieties.

—THE ZENOBIAS.—Amongst hardy shrubs now in flower in the Kew collection undoubtedly none are more beautiful than the *Zenobias*, with their lovely white, wax-like, bell-shaped blossoms. Any damp peat border where American plants, such as *Vacciniums*, *Kalmias*, *Azaleas*, &c., would grow, would also suit these well. The species are of fairly neat habit, and as they could be easily pinched in and kept to any size, few lovelier plants could be chosen for pot culture and the decoration of the cool conservatory. *Z. speciosa* has green leaves, paler beneath, and *Z. speciosa* var. *pulverulenta* has foliage lighter green above, the under-surface being covered with a thick glaucous bloom.

—SUNFLOWERS.—*Helianthus annuus*, the old-fashioned Sunflower one used to see so frequently in cottage gardens, is a plant that dates back to a very

remote period, it having been brought from Peru and first cultivated in England in 1596. There are several other kinds of quite recent introduction that are grown principally for the ornamental character of their blooms, most of which are of very large size, and in fine summers form most ornamental and conspicuous-looking objects planted in shrubbery borders backed by evergreens, a situation for which they are well adapted. Although the common annual variety will not bear comparison with such showy kinds as *californicus*, *argyrophyllus*, *striatifolius*, *macrophyllus*, *giganteus*, and a few others, in the display they make, it is much more valuable on account of the large quantity of seeds it yields, and the uses to which these and the plant may be put for agricultural and other purposes. The leaves are said to be an agreeable food for cattle, and those on the lower parts of the stems may be picked off without detriment. After affording a crop of fodder in this way, then comes the more plentiful one of seeds. The easiest method of gathering these is to cut off the peduncle or footstalk; and as the involucre is extremely thick it is necessary to hang or lay the heads in some airy place, to accelerate the drying, after which they may be stored anywhere for the use of poultry and pets like parrots and other hard-billed birds, which devour them with avidity. In the autumn, when harvest is over, and the fields are cleared of corn, pheasants wander far from their preserves in search of grain, and no better expedient could be adopted to keep them at home than to grow a quantity of Sunflowers near the margins of rides where there are bare open spots that could be turned to account and utilised for the purpose. All that is necessary is to break up the ground and dibble in the seeds a foot or so apart, and as the plants soon germinate, and are strong-growing, they are able to take care of themselves. Those enumerated above are best raised in heat in small pots, so as to get them early, when they may be hardened and planted out by the end of May or first week in June.

— **TABERNEMONTANA CORONARIA FLORE-PLENO.**—This plant is no doubt becoming much more largely grown than of late years. Whether for exhibition or decorative purposes it deserves to be in the front rank. The plant shown by Mr. W. Lee at the exhibition of the Reading Horticultural Society, on the 20th ult., was much admired by the gardeners present, and probably some came face to face for the first time with a subject of whose beauty and great usefulness they had but little previous knowledge. In one of the plant-houses at Gunnersbury Park Mr. Roberts has small bushy plants 18 inches or so in diameter, that are both well grown and flowered, and most useful subjects for cutting from. It is a plant that must be grown well and freely, if any one would succeed with it. In all probability some growers have been under the impression that to succeed with this plant it is necessary to starve it, and the notion may account for the sorry specimens met with occasionally. Mr. Lee had cultivated his plant liberally, and to all appearance had encouraged it to the very utmost. The plant bore this testimony to the zeal of the cultivator, and the latter was congratulated warmly on his marked success.

— **THE RESURRECTION PLANT.**—It may interest readers in search of the curious to know that Messrs. Hooper & Co., of the Central Avenue, Covent Garden, have been fortunate enough to secure several hundred specimens (a rare occurrence) of the curious and interesting *Selaginella lepidophylla*, which, on account of its remarkable hygroscopic property, has been dubbed the Resurrection Plant, though it no more comes to life when immersed in water than tea leaves do when they unfold in the tea-pot.

— **CYPRESSUS MACROCARPA.**—This fine Cypress flourishes near the sea, and nowhere have we seen it to greater advantage than at Eastbourne. It may not be able to bear the full blast of the south-west winds close to the sea like Tamarisk, but it does well in most of the gardens in the town. Many specimens have attained a considerable size, and assumed the habit of a Cedar—a characteristic of this species in an adult state. Talking of Tamarisk, we saw one ancient example against the gable of a house facing the sea, the trunk of which must be nearly, or quite, a foot in diameter, and the height nearly 30 feet. Tamarisk is, we may mention, very effectively employed in the same town on the steep slopes of the

parade fronting the sea. It is cut down annually, and the young growth makes a fine bank of green in summer, extending from the pier to the Wish Tower. Here and there, at the back of the concrete seat, which extends from one end to the other of the parade, the Tamarisk has been left, and trained over, in order to provide a little shade.

### ANTHURIUM SCIERZERI-ANUM.

THE illustration (fig. 139) represents a curious sport of this gorgeous plant, and which may if developed become the parent of a race of Anthuriums which will assufully attract attention. It has become now not uncommon to see two spathes surrounding the spadix, but in this case a large number of scarlet spoon-shaped bracts have been developed all up the spadix between the closely packed flowers. Botanically this

FIG. 139.—ANTHURIUM SCIERZERTIANUM, BRACTEATE FORM.

is what might be expected, as flowers originate in the axils of bracts. Our specimen came from the nurseries of Mr. Pattenson, of Carlisle. Last season the plant showed the same peculiarity. It is possible that some seedlings of this plant would reproduce the same condition and in an improved form, and the promise is so good that we should recommend the trial to be made.

— **NATIVE CALIFORNIAN TOBACCO.**—Prof. Rothrock is of opinion that the early natives of California smoked the leaves of *Nicotiana Clevelandii*, A. Gray—a species only quite recently described. It is a small plant with small flowers, and it was found by Prof. Rothrock only in association with the shell heaps which occur so abundantly on the coasts of Southern and Central California. He states that perhaps of all the remains of extinct races so richly furnished by that region, none were so common as the pipes, usually made of stone resembling serpentine. The Tobacco of *N. Clevelandii* Prof. Rothrock found by experience to be excessively strong.

### CHIA.

“DURING the summer of 1875,” writes Dr. Rothrock, “my attention was called, while in Southern California, to a mealy preparation in popular use. On inquiry I found it was called ‘Chia.’ Further examination proved that it was furnished by the seeds of *Salvia columbaria*, Benth. The seeds [nutlets] are collected, roasted, and ground, in the native way, between two stones. It is used as food by mixing it with water, and enough sugar to suit the taste. It soon develops into a copious mucilaginous mass, several times the original bulk. The taste is somewhat suggestive of linseed-meal. One soon acquires a fondness for it, and eats it rather in the way of a luxury than with any reference to the fact that it is exceedingly nutritious besides. It is in great demand among the knowing ones who have a desert to cross, or who expect to encounter a scarcity of water, and what there is of bad quality. By preparing it so thin that it can be used as a drink, it seems to assuage the thirst, to improve the taste of the water, and, in addition, to lessen the quantity of the water taken, which in hot countries is often so excessive as to produce serious illness. As a remedy it is invaluable, from its demulcent properties, in cases of gastrointestinal disorders. It also holds a place among domestic remedies for the same purpose that Flaxseed occasionally does with us—*i.e.*, a grain of the seed is placed in the eye (where it gives no pain), to form a mucilage by means of which a foreign body may be removed from the organ. I have found it of great service as a poultice. As a matter of archaeological interest, it may be noted that quantities of this seed were found buried in graves several hundred years old. This proves that the use of the seed reaches back into the remote past. Indeed, I find several allusions to it in Bancroft’s great work on the *Native Races of the Pacific States*. ‘Chianpinoli’ appears to have been made by the so-called Aztec races from corn which was roasted and ground as the chia was. Chia was, among the Nahuatl races of ancient Mexico, as regularly cultivated as corn, and often used in connection with it. Indeed, it was one of the many kinds of meal in constant use, and which appears to have gone then, as now, under the generic name of ‘pinoli.’”

### CHIVES.

IN *Soyer’s Cookery* a great many of the recipes begin with Onions fried, as if that were the root of the matter. We read of the whole Jewish nation almost rising in rebellion on account of the Garlic, which, though small, is still an Onion, and we are all familiar with the mild Portugal Onions of commerce; but there are hundreds of town-bred people who have never seen Chives, for they do not appear in market, and as Onions they are at the very lowest round of the ladder of kitchen herbs. Chives are perennial, and die down every year on the approach of hot weather, and appear again in the following spring, and, like all the other Onion species are fond of muck and moisture. Strange to say, good usage does not alter their character very much, neither does any reasonable amount of ill-usage hinder them from flowering and perfecting seed; for, like the Camomile in the old adage, the more they are trampled on the better they grow.

These pot herbs vary much with the culture they get. The common Leek is sometimes grown to look like a nice white Turnip, not being allowed to run to seed, and grown for two summers, so that once, when a dish of Leeks was put upon the exhibition-table in Edinburgh, well-informed people asked “what they were,” and “who had brought them hither.” Many persons grow Leeks, and blanch their thick stems, and think that this is all they are capable of doing; but Leeks and Onions have odd ways of their own, and if they are not allowed to seed, very large Onions may be raised from any of the species usually grown.

Chives are, however, the smallest of the tribe, and it is to them that I would now call attention. There are two sorts usually grown in the cottage gardens of Scotland, one with straight and slender foliage, and another with awl-shaped leaves, but the first is the sort mostly preferred. By a piece of the greatest perverseness the tops only are used, and the small bulbs are left unmolested. On this side Gretna the

English artisan longs for and eats Spring Onions, to give flavour to his flour-bread and butter, or to his fat bacon, and it is quite edifying to see with what a masterly air he handles this honest salad of Onions and salt. The Scottish housewife is born to other circumstances, and, like the French across the strait, has to keep the pot on the fire; and it is an excellent excuse for inferior cookery that the Scottish cookery is the most economical, and gourmards are held in abhorrence. The motto deeply cut in stone in a Scottish meal market was to the effect of "Eat that you may live, but do not live to eat."

"Ede ut vivas, attamen non vive ut edas."

The pot is early on the fire for the breakfast porridge, and again for dinner, and lastly for supper; and this is the time that crowns the work, for the standing dish in many farmhouses is still the "Kale brose of auld Scotland." It is to the everlasting honour of the poor Scottish mother that she not only feeds her family with plenty of wholesome food, but contrives to educate them at the same time; but to return to the spring Onions. The English market gardener sows in autumn a lot of Onions very thickly, so that being short of food they may be starved into small Onions—not young ones, and these are dug up in spring and trimmed for market to look like fresh "Ciboules."

tained, and he grew Lancashire prize Gooseberries in summer to get them few in number and fine. *Mrs. Forsyth, Salford.*

### SOILS SUITABLE FOR CINCHONA.

MR. HUGHES, in his interesting communication published in your issue of the 19th inst., draws particular attention to the character and influence of soils upon Cinchona culture as exemplified in Ceylon. The subject is one with which I have had considerable experience, I therefore venture to submit a few observations thereon.

The most important point in connection with the selection of sites for Cinchona culture on tropical mountains is that of securing a suitable soil—viz., a rich, friable, or gravelly soil. This fact is well known, as stated by Mr. Hughes. In a former letter of mine, published in the *Gardeners' Chronicle*, dated December 6, 1879, I referred to the complete failure which attended the first attempt (1862) to establish a Cinchona plantation in the island of Jamaica, chiefly in consequence of the stiff, impervious nature of the soil in which the plants were set. Bearing that experiment in mind, as well as the nature of the soil, which is considered an indispensable factor

But the result is especially remarkable on account of the nature of the soil and low elevation.

Throughout the domain of tropical agriculture the objects of cultivation, with rare exceptions, are amenable to successful production in every variety of soil. Cinchona presents one of those exceptions in a marked degree. Hence the successful issue of the experiment in tenacious clay, as indicated, is quite anomalous. The soil in this district, therefore, is precisely what should be avoided for Cinchona; indeed, in this soil, under ordinary circumstances, Cinchona would inevitably perish within a few months after being planted; but here the injurious character of the soil is counterbalanced by the peculiar geological formation. The whole district is composed of white limestone, on which rests a great deposit of stiff clay. Owing to the remarkably porous structure of the limestone there are no surface rivers or streams whatever; the surface drainage is conveyed by means of sink-holes to subterranean rivers. The superabundant moisture-retaining properties of the clay soil, so prejudicial to Cinchona, is thus by natural means counteracted—i.e., the subterranean drainage exerts a powerful influence upon the soil. *Robert Thomson, Purple Grove Cottage, Helensburgh, N.B.*

### A NEW GARDEN FRAME.

THE accompanying illustration (fig. 140) gives an excellent idea of a frame of a new pattern, designed by Messrs. Foster & Pearson, horticultural builders, Beeston, near Nottingham, and exhibited by them at the late summer show of the Royal Horticultural Society, where it met with great approval, and was awarded a Silver Medal. The frame is constructed of wood and iron, well designed, and substantially put together; and it is especially commendable for the novel, simple, and perfect mechanism by which ventilation is secured at the top, and the lights tilted to any desired height. The whole of the lights swing independently of each other on pivots, and are held open when desired either for giving air or attending to the contents, by the simple ratchet-like arrangement shown in the illustration.

### Florists' Flowers.

SEASONABLE NOTES.—AURICULAS.—Florists are much exercised as to the right time of the year for repotting Auriculas. One says May is the best month, another June, and even July. Many of the principal growers pot in May, and the plants potted at that time are now well established. Water them carefully, keep the leaves clear of greenfly, and remove the lights altogether unless it rains. Where the plants have not yet been potted, off-sets are forming very freely; these must be removed as soon as they are ready, treating them as already recommended. Continue to prick out and to pot off seedlings and off-sets as they require it. Collect the seed-pods as fast as they ripen, lay them out on clean paper with the labels attached. When the seeds drop out or can be readily separated from the husks, they should be at once sown. Alpines need not have any glass protection at this season; place the pots in a partially shaded place on a cool moist bottom. The potting and after-culture of these is the same as in the show section. The only difference is that the alpines are hardier, and do not mind exposure to the weather during the summer months.

### CARNATIONS AND PICOTEES.

Look over the plants at least once a day with the water-pot; any check to their growth now would be very detrimental to the bloom. The flower-buds are now sufficiently advanced to require looking over, and those that have a tendency to burst should be tied round with matting, or, what is preferred by some, waved linen thread. Tie moderately tight, and in some cases it may be necessary to slit down the pods a little on the side opposite to that likely to split. It is also necessary to place cards on some of the flowers if it is intended to exhibit them; if this is not done the guard petals reflex and become twisted or curled in some cases. It is now a good time to put in pipings or cuttings: the smaller growths are best for this, and there are sometimes growths too far up the stem to be layered, all these must be taken off and put in pots, using fine soil; the labels must be marked, and a corresponding mark must also be put on the label of the plant from which the pipings were taken in case the flowers should be run.

FIG. 140.—MESSRS. FOSTER AND PEARSON'S FRAME.

beyond being tall and rather tough, they answer the purpose already named of salad for the artisan. The cooking of the Kale in Scotland differs from that usual in England; for in England it is simply put into boiling water and boiled till tender, but in Scotland it is boiled much longer, and when the liquor has been strained off either cream or butter is added and the brose made. In springtime Chives are added to the curled Kale, no doubt for the same reason that Soyer fried his Onions before he set about his "made dishes."

Now when I had charge of other people's property I found that there were many little things that of themselves were not much, but in the aggregate they told either for or against me; and although some things would fail, if there were any others that succeeded it helped to put the balance on the right side. With the aid of friends and neighbours I got a stock of Chives, and had every bulb separated so that I could transplant them into rows and keep them well watered. They grew freely, but instead of cutting off their tops, as was done everywhere, I dug them up root and all, and when they were ready for the salad-bowl they were unlike any other of the Onion tribe. They do best only 1 inch from the surface, and do not need blanching like Leeks, but as spring Onions. I may go a long way before I see their like again.

The late Mr. Barnes, of Bicton, excelled in small things; his salad herbs in winter were well main-

in Cinchona growing, the following account of this tree, thriving under anomalous conditions, may be interesting.

In 1868, when the first successful Jamaica Cinchona plantations were started, some hundreds of plants of *C. succubra* were sent to a distant part of the island, and planted at a height of only 2000 feet above the sea. A few years thereafter Sir J. P. Giant, the governor, with an enlightened desire for the amelioration of the colony, and to whose administration Jamaica is indebted for Cinchona plantations, requested me to make an official tour of the district in question, a large extent of which belonged to the Government, in order to report on its eligibility for Cinchona cultivation. My report was unfavourable, in consequence of the stiff, clayey soil which abounded. Nevertheless, to my surprise, the Cinchonas I had sent a few years previously had attained large dimensions, having grown at the rate of 5 feet a year. Practical experience pointed to totally different conditions of soil and altitude.

Later on other batches of Cinchonas were distributed and scattered many miles apart in that district. I again inspected these trees in 1878. Trees eight years old measured from 30 feet to 35 feet, with trunks near the ground 2 feet in circumference. The first shipment of bark was made when the trees were seven years old, and this bark fetched in London 2s. 1d. per pound—a highly satisfactory result, considering the age of the tree and its rapidity of growth.

plants in patches near the edgings, and beneath tall growers, by way of furnishing the ground, which must otherwise be bare because of the impracticability of planting large growing plants closer together, or too near the edges, because of the ragged appearance they present when they exceed their boundary. Many plants in such mixed borders now require supports, notably so Pyrethrums, Potentillas, Carnations, Dahlias, and Hollyhocks. Thin out annuals that have been sown in the borders; and as it is now getting late for planting out any other annuals, fill up any vacant spots there may still be with spare bedding plants, such as Pelargoniums, Petunias, or Calceolarias, as also with seedling Wallflowers, Snapdragons, Sweet Williams, and Canterbury Bells. The earlier-flowering Roses, particularly climbers on south walls, should now have all their old flower-stems cut away, and the longer shoots shortened back, and then be given a thorough watering with strong liquid manure to assist in the production of a good second edition of bloom. Cut off dead and decaying flowers from all other Roses, for by thus being relieved they will the quicker form buds. As soon as they are fit, the budding of Brier stocks should be commenced. Now that planting out is entirely off hand more time may be devoted to the maintenance of neatness by keeping lawns closely cut, edgings of walks and borders trimmed, and the walks weeded and well consolidated by rolling after heavy rain. Complete the clipping of Box edgings and evergreen hedges, also the pruning of shrubs, and the removal of seed-vessels from Rhododendrons that have done flowering, together with any straggling growths necessary to keep the plants in bounds and of good form. *W. Wildsmith, Heckfield.*

#### HARDY FRUIT GARDEN.

The refreshing showers of the past week have done much towards giving a healthy tone to vegetation generally, and bush fruit trees have been relieved of many insect pests and their larvæ by the force of the rain; and now that we have gained a little ground over these troublesome pests advantage should be taken of the occasion, by way of keeping them under for the remainder of the season. The soft points of the shoots, both of bush and wall fruit trees, are generally the parts most affected, and by removing them promptly a saving of further labour is effected, as well as preserving the health of the trees. Where canker is prevalent in wall trees or espaliers, limbs or branches that there is any suspicion about being diseased may be left for the present season, but a young shoot should be taken away from the base of its nearest and healthiest neighbour, to take its place next year. Wall trees, as a rule, are not cared for as much as cultivators would like in summer, owing to pressure of other work; the breastwood is too often pruned away in a reckless rough-and-ready fashion, but if there were better opportunities of attending to wall trees properly in summer, a good deal could be done towards their regeneration by encouraging healthy young shoots from the base of different parts of a tree occasionally, and removing some of the old limbs which have grown stunted and decrepid at the winter-pruning. The laying-in of breastwood in the case of Peaches and Nectarines is an operation of the first importance at this season. The necessity of having the work performed by skilled hands has become more important of late years owing to lack of sunshine and excessive wet. It cannot be too often repeated, that, in the case of stone fruits, there need be no fear of gumming or any other injury being sustained from the effects of summer thinning; therefore, at the cost of making an effort, the pinching, thinning, and removing of all superfluous growths should be seen to in due season, in order to secure an equality of vigour in all parts of the tree, and to retain only such shoots as promise to be fertile next season. For example, if a shoot had been left when the tree was dis-budded, because it was bearing a single fruit at or near its extremity, and the fruit through some cause or other turned out an abortion, this shoot might be removed down to its base, and a single one taken away where there were three or more weakly ones before. Again, if there be symptoms of extreme vigour in another part of the tree such shoots should either be removed at an early stage of growth or pinched at the fourth or fifth eye in order to divert or spread the flow of sap into as many growths as will have the effect of correcting the redundancy of sap by extending the surface which it goes to supply. I must, however, point out that stopping upon open walls must be done very early in the season, or the shoots that are produced by it will not have time to ripen, and will probably perish the following winter if the weather be severe. The protection of Cherries and Strawberries from birds is now demanding the utmost vigilance: their attacks are of so determined a character here that we find the only safe plan is to contest the position openly with our enemies and to give them a warm reception at daybreak. Those who tied up their Strawberries as indicated in my

last Calendar are now reaping the benefit of the little extra labour in having clean handsome fruit for dessert, as well as saving a quantity that would become a prey to slugs or rot, if left lying flat upon the ground. If through circumstances of any kind the supply of Strawberries has got into an unsatisfactory state, now is the best time of the whole year to make a fresh plantation from young plants. If a suitable quantity are layered in large 60-sized pots and were supplied with water until they have formed plump crowns and then planted out in a rich open quarter they will make strong plants by the end of the year and bear a handsome crop of fruit next season. *W. Hinds, Canford.*

#### FRUIT HOUSES.

MELONS.—As with every other branch of industry so with horticulture, details must be carried out in accordance with the special circumstances surrounding each individual case; and for this reason repetition in Calendar writing is necessarily unavoidable and dry, and must, under the force of circumstances, continue to be so, more especially where there is no variety of subjects to write about. Therefore, under these circumstances, we shall have to reiterate former remarks in the present Calendar. The weather we have been having during the last fortnight cannot be considered as having been favourable to Melon culture in general, inasmuch as it has been dull, wet, and cold for the time of year, necessitating the fires being stirred up and the linings of dung frames being renewed, with a partial cessation of the syringe being applied to plants growing in the latter structures. However it sometimes happens that during such unsettled weather irreparable mischief is caused through the sun "popping out" suddenly with all the force of a clear summer's day when there is comparatively little air in the various structures, and which, if not immediately and adequately increased, results in the plants and fruits being scorched. Hence the necessity of being always on the alert during such fickle weather in putting on and taking off air—even though it should be a continual repetition of one and the other. The necessary thinning, tying, stopping, and arranging of shoots should be regularly attended to, and with these details no pressure of work, which is felt more or less in the generality of places just now, should be allowed to interfere, for in no other department in the garden do detrimental results so speedily follow in consequence thereof; therefore let all cultural details be regularly attended to. See that successional plantings are landed up as soon as the roots begin to push through the sides of the hillocks, and that the supports are put to the fruits (as recommended in a former Calendar) as soon as they require them. Examine the plants occasionally at the roots, and see that they have plenty of water when requisite, but in no case let there be a surface-watering, but a thorough soaking when they require it. *H. W. Ward, Longford Castle, Salisbury.*

#### CUCUMBERS.

Plants in full bearing and almost in every stage of growth will now require copious supplies of water to the roots, also plenty of atmospheric moisture in the houses, and the plants should be syringed thoroughly twice a day, and plenty of water thrown over the floors two or three times a day during bright and sunshiny weather between the syringings. All fruits should be cut as soon as they have attained the proper size, and placed on their ends in saucers in a cool fruit-room in a half inch of water. This will not only relieve the plants of their weight, but materially assist in the swelling off of the smaller fruit. As a matter of course, the general routine of work will be proceeded with in the usual way. *H. W. Ward, Longford Castle, Salisbury.*

#### PLANT HOUSES.

STOVES.—Now that we are getting our full amount of light, and clear sunny days, the most important matter connected with stoves is to see that the atmosphere is kept in a continuously moist condition, as nothing is so depressing to plants as to stand in houses where rapid currents of dry, heated air are passing through; but if the air in its course can take up and become charged with aqueous matter drawn from the cool surfaces it passes over, the foliage feels it at once, and instead of flagging through excessive loss of sap by evaporation, stands out bold and erect in the manner it should. This being so, the floors and other available plants under the stages should be damped down frequently, and in the afternoon when the lights are closed a heavy syringing given, in doing which it is always desirable to drive the water well into the points of the shoots and under the leaves of any climbers at all liable to insects, as by this means they may be dislodged, and the plants kept clean without much expenditure of time or labour. In cases where the foliage is at all soft and tender, care will of course be required in directing the stream, but with such things as the Stephanotis the garden-engine may be brought into play without doing the least harm, as the tissues are hard and will bear it. The water,

however, that is used for the purpose should always be soft and perfectly clear, otherwise a deposit is left, which not only causes a disfigurement, but stops the pores and thus affects the health of the plants. The flowering capabilities of most of these may be greatly augmented by frequent applications of liquid manure, which is essential for all roof climbers having their roots restricted, as just at this season the demand that is made on the feeders is something enormous. Although this is so, it is a mistake to give strong doses, especially if the stimulant happens to be derived from guano or any of the artificial compounds, which are of a hot nature and dangerous, but where sheep droppings can be obtained wherewith to make what is needed, or drainings from the cowyard can be got, nothing answers better, especially if a little soot be added to the liquid and so managed as to be in a perfectly clarified state before using. Where this kind of manure-water does harm is when it is turbid, in which state a sediment is left on the surface of the soil, where it becomes encrusted and prevents the air from entering, and as this is the great sweetener and purifier of the earth and almost as necessary for the roots of the plants as for the tops, it will be seen that they cannot remain long confined in that way without suffering an injury. Not only is it requisite that the surface of the soil should be free and open, but it is quite as much so that the pots be kept clean on the outside, where, from being continuously wet, a slimy growth forms, which soon acts in such a way as to seal up the pores of the vessel.

GREENHOUSES.—In cases where the roofs of these structures are ornamented with climbers, it will be necessary to keep them well thinned out, that the occupants beneath may have plenty of light, without which none of the soft-wooded plants, so much in use at this time of year for affording a display, will flower in the free manner they otherwise would. Pelargoniums for autumn blooming will do best after this plunged outdoors in some situation where they can have shelter and full sun, under which conditions the growth they make will be short-jointed and firm, and the same with double Petunias and the numerous annuals that are being got up for pot-work. Camellias that made their young wood early ought now to be showing their blossom-buds—a time when many cultivators consider the most seasonable for potting; and where this operation is intended to be carried out there should be no delay, as when they get in a more forward state there is a great risk of the buds dropping through the root disturbance the plants undergo, for however carefully they may be handled a check cannot be avoided, even though the old balls may not be reduced. In shifting Camellias there is no soil answers better for them to grow in than good tough fibry loam, which, with just a slight sprinkling of soot and a little thoroughly decomposed cow manure, imparts a fine healthy green to the foliage. As the plants require much water, it is essential to success in their cultivation that the drainage be free, to secure which an inch or so of fine broken crocks should be used, with some of the rougher portions of the soil placed so as to prevent the interstices being choked. The majority of greenhouses being too dry and hot for Camellias to stand in after this, it will be advisable to get them out at once, and the best site for them is on the north side of any tall trees or shrubs. This with the refreshing dews they get when so circumstanced, is just the thing that will enable them to recoup and add greatly to their health and vigour. Azaleas, too, are much benefited by being stood out for a time, but these will bear more sun and do best if they can get the solar rays from four to six hours each day, which, without distressing the plants, help materially in ripening the young shoots and hardening the leaves for the winter. It should be borne in mind that the watering to which plants are subjected is a great attraction to worms, to stop the ingress of which the pots should be stood on slates or tiles, the latter, if flat, being the most preferable, as from their porous nature they allow the drainage to go on without interruption. *J. Sheppard, Woolkeston Park.*

VITALITY OF EUCALYPTUS SEEDS.—Baron von Mueller writes: "It may interest your readers that Eucalyptus seeds show an unexpected tenacity of life. I took from my dried plants of *Eucalyptus miniata* seeds, which were for experiment gathered in 1867. They were committed to the care of Mr. Will. Elliott, one of our best horticulturists, and he had the satisfaction to see nearly every grain germinate. It is possible that the seeds of *E. miniata* may retain their vitality longer than those of the species with smaller seed grain; still, this unexpected fact is interesting. My former experience led me to think that Eucalyptus seeds germinate better when stored for a short time than when quite fresh, the embryo undergoing probably at last still some final maturation. *E. miniata* is as gorgeous a species as *E. phœnicia*, both having the fiery blossoms of a *Callistemon*, and produce for a much longer succession of weeks their flowers than the splendored *E. bicifolia*."

## APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, June 29	Royal Horticultural Society's Rose Show, and Pteridomania Society's Exhibition, Sale of The Walkers, Sellaine, at the Mart, by Messrs. Brown, Roberts & Co.
WEDNESDAY, June 30	
THURSDAY, July 1	Royal Botanic Society's Evening Fete Croydon Horticultural Society's Show Latham Rose Show Canterbury and East Kent Rose Society's Show
FRIDAY, July 2	
SATURDAY, July 3	Reddington Horticultural Society's Show Leicester Horticultural Society's Show National Rose Society's Show, at the Crystal Palace Southgate Horticultural Society's Show.

It is no doubt news to a large body of Potato growers to learn that there is now sitting in the House of Commons a committee, with Major NOLAN, M.P., for its chairman, which is

fresh to tell us, or new suggestions to offer. They have shown the nature of the disease, what it is, and how it works; and they have also exploded those semi-superstitious ideas which have prevailed respecting its origin. No sane person now attributes it to judgments for national sins, or to the action of electricity, and only blockheads who will not read and learn persist in asserting that the disease is entirely the result of bad cultivation. It is lamentable, however, to see that cultivators, as a rule, take no steps whatever to turn to account the lessons which have been laid before them by the laborious and unthankful researches of the scientist. They take no precaution to destroy

Unfortunately they destroy those of their neighbours also.

It is obvious that any inquiry the committee may further make will be incomplete, unless it takes the evidence of several of our leading and most observant growers, because, as science would appear to have accomplished all that it is in her power to do in the matter for the present, any ultimate practical dealing with the disease must be looked for at the hands of growers and raisers themselves. Whatever they may accomplish, however, there will still remain the fact that our Potato crops must ever be at the mercy of the elements. If we could ensure seasons without rainfall from

FIG. 141.—GREENLANDS, HENLEY, THE SEAT OF THE RT. HON. W. H. SMITH, M.P. (SEE P. 806.)

engaged in the labour of endeavouring to master all the intricacies and incidents relating to THE POTATO DISEASE. Although termed the Irish Potato Diseases Committee, yet it is obvious that the same interest must attach to its labours and inquiries as would be the case were its denomination of a more cosmopolitan order, inasmuch as the disease is the same everywhere, has the same manifestations and effects, and if grappled with in one place could equally be dealt with in other localities. Sitting only on Tuesdays and Fridays, the committee has so far chiefly confined its inquiries into the scientific aspects of the subject, and that these, so far as our present knowledge extends, will be exhausted there can be no doubt. Unfortunately the scientists have little if anything

the diseased haulm directly it shows itself—they give diseased tubers to the pigs and fowls, and propagate the disease wholesale by means of the manure heap. They are not by any means careful enough to pick out and destroy diseased tubers from among those retained for seed. In fact, as a rule, they do what they ought not to do, and they leave undone what they ought to do. Were such practices confined to ignorant labourers we could not be surprised; but when men with intelligence enough to be examined before a House of Commons committee say—if correctly reported, which we doubt—"that diseased Potatoes are, if anything, preferable for feeding cattle" to sound ones, we confess to a feeling that such men are rightly served when they lose their crops.

the middle of June to the end of August, there would be little cause for fear, as within that interval the great bulk of the Potato crop would have matured; but with even very occasional falls of moisture and even heavy dews, supposing the atmosphere to be laden with the fungoid spores, there would be enough of the required element to set these living germs agog and spread the disease throughout the land. Because of this very characteristic, the natural humidity of her climate, Ireland presents one of the worst possible countries in the world for the cultivation of the Potato. All experience goes for nought, if it is determined still to continue to grow Potatoes year after year in a climate where, in all ordinary seasons, the disease is an inevitable visitant, and no doubt the wisest

advisers of Ireland's sons will be those who invite them to discard the cultivation of the Potato, and to grow some other produce not amenable to such dire visitations.

It is hoped that the kindly efforts made to distribute many thousands of tons of Champion Potatos for seed in Ireland may do something to mitigate the evil, though we must own that we are sceptical on that point. It will be a very severe test of the power of that Potato to withstand the disease—a test under which, it will be remembered, that Flourball, sent from this country with such a good reputation, broke down. Champion, moreover, is such a late ripening kind that its wide cultivation will but largely

unreasoning clamour and resistance. But we say emphatically, whether regarded as a national diet, or as an agricultural crop, the Potato is not Ireland's friend; and until the time comes—a time in spite of scientists, committees of inquiry, Potato shows, &c., alas! too remote—when the disease shall curse the Potato crops no more, it will be well to induce and encourage the myriads of cottier farmers to trust for a livelihood to some more reliable and healthy crop. If the Irish would partake more of cereals or pulse, and less of Potatos, in a few years a mental and moral revolution would be worked in the population. In the meantime a vast amount of good may be done by the introduction into that country

it has been in the past. The mild season will be succeeded by a disastrous one, without doubt, until the end of time. Our chief hopes lie in the following directions.—The Potato murrain may, as in similar cases, become less virulent as time goes on; that cultivators will not be content, as now, to do next to nothing in the way of prevention, and that sooner or later some method of culture may be devised which shall neutralise the effects of the fungus, or some variety may be raised which shall deserve the name of disease-resisting. These are hopes that have been long deferred, though at times stimulated by what is learnt of one or two sorts, that show powers not general in the Potato. We

FIG. 142.—VIEW IN THE GROUNDS AT GREENLANDS, NEAR HENLEY. (SEE P. 806.)

intensify the evil of distress now existing, as it is hardly probable that any produce will be ready for eating until October, and the moist nature of the atmosphere may keep it growing and fearfully exhausting the soil, should the foliage escape the disease, even till cut down by frost. It would indeed be a grave misfortune were this to result, and it will be a blessing if all that is hoped for should follow; but it is well to point to the danger that may come, and with respect to which some of our own growers, who understand the character of the Champion, have not been entirely silent.

Ireland is so emphatically a Potato-growing country, and its agricultural inhabitants so largely Potato eaters, that any attempt to break off the connection will no doubt provoke much

of kinds of Potatos that will ripen off early, leaving the void created by the absence of late kinds to be filled up by purchase from other and more fitting Potato growing countries. Had one half of the Potatos planted this season been Early Rose the distress existing amongst the population might have been considerably lightened at least six weeks earlier than will now be the case, and by the wide introduction of early ripening kinds, it is not only now but in future years the possibility of famine may be largely avoided.

We are yet entirely at the mercy of the seasons. The bright warm sun is our best friend, a cloudy sky and cold moist atmosphere our greatest enemy. To look for better things in that direction is hopeless, except for temporary relief, as

want not one or two but twenty such kinds, not only late but also early, of all seasons and colours, and of the best table quality. We want to have such as shall inevitably supersede and drive out of cultivation all old kinds that are most amenable to the effects of the fungus. Our hope, therefore, rests with intelligent raisers, who will work for that one end. Perhaps, having regard to the enormous trade interests involved in Potato culture, it might be thought a matter to which the Government might well turn its attention, but British governments cannot be charged with any special anxiety for the promotion of practical horticulture, and therefore nothing must be expected in that direction. If some private raisers can, either by direct effort or indirect luck, succeed in obtaining the avowed

desideratum, the result will be an universal boon, and merit national recognition. In the meantime we commend to the notice of our readers a little treatise recently published by Mr. BRAVENDER, entitled "The Potato Disease, and How to Prevent It," which contains much information worthy the consideration of the cultivator.

We have received for publication the following letter, the importance of which justifies us in giving it this prominence:

TO ENGLISH HORTICULTURISTS.

"You are no doubt aware that in order to prevent the invasion of the Phylloxera, a Convention was signed at Berne on September 17 last, by the Plenipotentiaries from the Swiss Confederation, Italy, Spain, Portugal, Austria, Germany, and France, to the effect that in future all horticultural produce would only be allowed to be imported into the countries in question under certain conditions, one of which stipulates that the roots of all plants must be completely divested of soil, which, in fact, signifies a total prohibition of the introduction of plants.

Italy and Spain, finding the terms not sufficiently stringent to satisfy their exigencies, have refused to ratify the Convention, and have forbidden the entry of all plants, while the Swiss Confederation interdicts the introduction of all horticultural produce coming from countries forming no part of the Convention, even when such sendings are accompanied by a Consular Certificate, which is deemed an insufficient warrant.

If these severe measures are maintained or put in force, it is evident that they will cause the inevitable and absolute ruin of many horticultural traders, and inflict a lasting and unequalled injury to horticultural industry in all countries where it now flourishes. No other branch of industry requires, in fact, a vaster or wider field for operation, and hence in presence of such a dreadful calamity we, the Ghent nurserymen, have formed a committee, with the object of protecting by all just means the interests of our threatened industry. The committee immediately summoned the Belgian nurserymen to a meeting, exposing the gravity of the situation, and a petition to that effect was sent to the Belgian Foreign Office. The Ghent delegates undertook to instigate a public interpellation in the Belgian Parliament, while a special deputation, in order to support the petition and to testify to the intense danger threatening the horticultural industry, conferred with the Secretary for Foreign Affairs.

Notwithstanding the activity displayed in the matter by the Ghent committee, the last intelligence received seems to be unfavourable, more particularly as regards Germany, whose frontiers, it is said, will be closed on or about July 1. This fact is of the highest importance, as it may be supposed with some certainty that the other countries signatory to the Convention will act in the same way as Germany.

The committee consider that their interests are identical with yours, and that the danger menacing Belgian horticulture will also fetter the progress of your country, and therefore deem it quite essential on your part to take immediate and serious action, in order to present a petition to your Government, either through the medium of a scientific or horticultural committee, with a view of obtaining a modification of the Berne Convention, especially to claim the revision of Paragraph 4. Art. III., requiring that the roots of all plants must be divested of soil, which is the most absurd feature of the recently enacted regulations to prevent the spread of the Phylloxera. A Government like that of England, a country of the first rank for industry and commerce in general, and occupying a great position in horticulture, could do much to stay the danger, more especially as it plays a preponderant and influential part in all important questions, which eventually must be settled through diplomacy.

We are sure that if all nurserymen of the countries menaced by the Convention act in a body our just cause would find many sympathetic supporters amongst the influential classes, and which would perhaps ward off the death-blow dealt against our industry.—For the Syndicate of Ghent nurserymen,

A. VAN GELRI, President.

We give the communication which our Belgian friends have favoured us with as nearly as possible in their own words, merely altering a few expressions which are not quite in accordance with grammatical construction, as must necessarily happen when a foreign language is made use of. If our correspondents will further favour us by referring to the recent numbers of this journal they will perceive that we have

been from the first fully alive to the dangers that beset legitimate commerce, and that we have done our best to point out the gravity of the situation. Further than this, the matter has, at our instigation, been brought before the Royal Horticultural Society, who have addressed a memorial to the Government on the subject, the receipt of which has been acknowledged, with the usual official intimation that the subject was receiving attention. As journalists we do not know what more we can do in the matter. We have, on more than one occasion, given in brief the natural history of the insect; we have shown over and over again the absurdity and futility of the regulations enacted by the Berne Convention, and, we are humiliated to say, by some of our own colonies. It is now for the horticulturists themselves to move in the matter.

PLANTS IN LIVING ROOMS.—There was once, still is, perhaps, a superstition that plants in rooms are unwholesome. Setting aside special cases it may be said that, as a general rule, plants in a living room, if they have any perceptible effect at all, are beneficial rather than otherwise. We are glad to see the Faculty taking this view of the subject. An American physician has, it seems, pointed out that by their powers of transpiring moist vapour plants render great service in rooms warmed by dry air. The value of plants and flowers as *délassement* for the weak and weary is acknowledged on all hands. Dr. ANDERS, according to the *British Medical Journal*, goes further, and states that the pursuit of gardening, though naturally it favours rheumatism, appears to arrest consumption in persons of phthisical tendency, while the abandonment of the pursuit in other cases led to the development of the disease. Dr. ANDERS recommends a room well stocked with plants as a complete and agreeable health-resort free from the inconveniences of travelling and the anxiety of separation from home. We concur with our contemporary in the opinion that the Doctor has opened up most interesting subject for investigation.

RAILWAY MAP OF CARLISLE.—MR. JOHN ABBEY, of the Railway Clearing House, Euston Square, has just issued a railway map of Carlisle, in connection with the forthcoming Royal show in the Border City. Intending visitors and exhibitors in quest of such a useful thing cannot do better than procure a copy.

THE PELARGONIUM SHOW.—MR. SHIRLEY HIBBERD'S lecture on Pelargoniums, in connection with the exhibition of the Pelargonium Society, will be delivered in the Council Chamber of the Royal Horticultural Society on Tuesday next, at 3 P.M.

THE ART OF GROWING ROSES.—The Rev. O. FISHER has published a fourth edition of his useful little treatise on this subject, one of the least pretensions but most thoroughly practical of the many treatises on the same subject. It may be had from Messrs. BRADBURY, AGNEW & CO., for a few pence.

THE EAST KENT NATURAL HISTORY SOCIETY.—The report of this Society for the year 1879 contains, among other things, an excellent account of the geology of East Kent, by Captain MCDONALD, which should be studied in conjunction with the local flora and with the data furnished by the gardeners and farmers.

JOURNAL OF THE ROYAL MICROSCOPICAL SOCIETY.—This journal, edited by Dr. CRISP and others, appears bi-monthly, and is remarkable for its record of current researches, relating to microscopic creatures, whether animal or vegetable. This record and the bibliography connected with it are very valuable features, which we hope to see not only maintained but developed.

SPRING BEDDING.—A visit to Castle Ashby, the seat of the Marquis of NORTHAMPTON, just now would reward any one desirous of seeing what a charming display can be made, and what a decided effect may be produced by means of inexpensive spring-blooming plants, such as Silene, Limnanthes, Nemophila, half-a-dozen sorts of Pansies and Violas, and a few other things, equally within everybody's reach, got

ready and planted last autumn. A great treat was afforded last week on the occasion of the visit of the Midland Union of Natural History Societies, to many of whose members it was in the nature of a revelation that such a brilliant specimen of bedding-out was possible with such materials. Late as it is for such plants they are still in the highest beauty.

CORK AGRICULTURAL EXPERIMENTS.—We are glad to see that a series of experiments are being carried out under the auspices of the County and City of Cork Agricultural Society, with a view to ascertain what varieties of Potatoes are most suitable for culture, what are the best manures, and so on. Similar experiments on grass, Barley, Oats, Turnips, and Mangels are being carried on simultaneously.

FREE SEATS IN THE PARKS.—Why there should be any other than free seats in our public parks we cannot understand, any more than we can understand why there should not be ten times as many seats as there are. A large proportion of the persons who visit the parks on foot are glad to be able to sit down to rest and enjoy the fresh air, and trees, and flowers, and birds, and it is an intolerable imposition that they should be compelled to pay for the privilege; or, on account of the fewness of the free seats, keep on their feet, or risk taking cold by sitting on the grass. Lord ORANMORE and BROWNE'S recent question in the House of Lords on this subject was well-timed. Considering the amount of money expended on the parks, and the manner in which no inconsiderable sum of it is expended, it would be absurd to say the public purse could not afford seats. We have just been turning over a report on the public parks and gardens of Berlin, wherein it is stated that there are 16,505 free seats; and in 1876 there were upwards of 7000 in the public parks and gardens of Paris.

THE PLAGUE OF FLIES.—A writer in one of the medical journals states that, by sponging the neck and flanks of a horse with a cold infusion of Walnut leaves, relief from the plague of flies will be found in a manner not less agreeable to the rider than to the steed. This is an old remedy, whose utility we can vouch for.

PHYLLOXERA.—M. BOHEAU reports in the *Comptes Rendus* that Vines treated with sulphide of carbon applied to the soil in the proportion of 20 grammes per square metre have thriven well.

THE BRITISH MOSS-FLORA.—DR. R. BRADSHAW-WHITE has, under the above title, commenced the publication of Monographs of the families of British Mosses, each complete in itself and illustrated by plates of all the species, with microscopical details of their structure. The first part is before us, and justifies us in saying that no student of these plants can afford to dispense with this work.

FLOWERING AND FINE-FOLIAGED ANNUALS.—MESSRS. JAMES CARTER & CO., of High Holborn, have an extensive and interesting display of flowering and fine-foliaged annuals on view in the long corridor, in the Royal Botanic Society's Garden, Regent's Park. They are in fine condition now, but should be seen at once by those who contemplate a visit.

SMALL THINGS.—It is not so very long since something akin to a feeling of contempt was manifested towards those who spent their energies in investigating bugs and spiders, and *à fortiori* towards those who treated the microscopic research of otherwise invisible organisms as anything more than harmless pastime or ingenious trifling. Now, however, it is found that the investigation of the life-history of the minutest creatures may have most important results as to the welfare of the noblest of creatures—man himself. "In the midst of life we are in death" is a truism which does not yet come home to men in general as a truth, and yet it is absolutely certain that decay and degeneration go on contemporaneously with progress and development even in the healthiest organisms. Further, it is proved that decay and decomposition are associated with the presence of minute living creatures of various kinds in infinite numbers. Whether these bacteria, and like organisms, are the actual cause of the decay, or whether they are mere consequences, is open to doubt, but at any rate they are inseparably

connected with it. Moreover, PASTEUR'S experiments prove that pure air does not induce decomposition. If air can be rendered pure, and freed from the presence of these organisms, then decomposition does not occur. Hence it appears that the well-doing of patients after operations is vastly promoted, and their tendency to die greatly lessened, by the adoption of what are called antiseptic measures—measures, that is, which are calculated to prevent the access of, or to stop the growth of these minute creatures. Incomplete as our knowledge is on many points, there is a general consensus of opinion among surgeons that great advantages have arisen from the adoption of the antiseptic precautions so powerfully advocated by Mr. LISTER; and on reading the statements of various surgeons, and noticing the differences of opinion expressed by them on secondary points, it would seem that in all probability the discrepancies in question arise simply from imperfect knowledge. Some of the organisms may be harmless, or only hurtful at a certain stage of their existence, or under special circumstances. All these facts indicate the necessity of further investigation, and they should impress on the outside public the necessity of awarding a generous and intelligent support to those who are working for the good of humanity, and not contemptuous indifference, still less hostility. It may seem incredible that the latter feeling should have any existence, but that it does exist is proved by the proceedings of anti-vivisection, anti-vaccination societies, and the like. It is estimated that one surgeon alone has, by his operations, added in sum the total of 22,272 years to the duration of human life; and this has been effected to a large degree owing to the experience obtained from the painless experiments which some so well-meaning but wrong-headed persons are doing their best to prohibit. It is only by protracted investigation of a similar character to that which has produced such beneficent results in the case of surgery that we must look for mitigation of the effects of Potato-murrain, Phylloxera, and the other ills which mock the efforts of the cultivator.

— DESTRUCTION OF THE PALM-HOUSE IN THE ROYAL GARDENS AT POTSDAM.—The beautiful Palm-house on the Pfaueninsel (Peacock Island), near Potsdam, constructed by FREDERIC WILHELM III., was destroyed by fire, together with all its valuable contents, during the night of May 19–20. It was erected for the celebrated collection of Palms purchased from FULCHERON, of Paris.

— JAVA.—In the April number of the *Indian Forester* is an account by Dr. KING of his visit, at the instance of the Indian Government, to the Cinchona plantations of Java. This report contains some facts of great importance to our cultivators, on which account we deem it well to record them. From this it appears that the soil is of volcanic origin, is rich in potash, and almost identical in composition with the soil on the Andes, where the Cinchonas grow wild. At an elevation of 5100 feet the temperature at 6 A.M. ranges from 50° to 60° Fahr., except during the two dry months, when it occasionally falls to 44° Fahr. The highest day temperature is 73.5 Fahr., the mean of the year 53°, while the constant temperature of the soil at 5 feet from the surface stands all the year round at 64° Fahr. The annual rainfall varies from 120 to 140 inches. The rainy season extends from November to June, but there are very few days absolutely without rain. The climate is so remarkably uniform that the weather for the day can be predicted every morning from the temperature about sunrise. The Cinchonas flourish under such conditions better than in Sikkim, in particular the variety *Lodgeriana* (figured in our columns, 1879, vol. xii., p. 457), and which produces a bark yielding as much as 13 per cent. of quinine. The Dutch have introduced the system of grafting the better kinds of Cinchona, and they adopt a process of shaving off the bark of the trees. This process, it is alleged, does not materially injure the tree, the bark is renewed, and less harm is done than by the late Mr. McIVOR'S plan of stripping and mossing. Dr. KING is satisfied that our Government possesses in Sikkim the true *Lodgeriana*, although, owing to different conditions, the yield of quinine is not so large as in Java.

— MIDLAND UNION OF NATURAL HISTORY SOCIETIES.—The third annual meeting of the Associated Scientific Societies of the Midland Counties,

twenty-four in number, and comprising 3000 members, was held at Northampton last week, on Thursday and Friday, under the Presidency of Sir HEREWALD WAKE, Bart., who delivered the opening address. The report of the Council, read by the Hon. Sec., Mr. EDWARD W. BADGER, reviewed the progress of science and the more important work done by the scientific societies in the Midlands during the past twelvemonths. It recorded, among other things, the near completion of MASON'S Science College at Birmingham (which will be opened with an address by Professor HUXLEY, F.R.S., on October 1 next), and the formation by one of the societies in the union—the Birmingham Philosophical Society—of a fund for the endowment of scientific research, which, though only recently commenced, already amounts to £700 from donations and £70 annual subscriptions. One grant has just been made to Dr. GEO. GORE, F.R.S. (author of the *Art of Scientific Discovery*), of £150 a year for three years, to facilitate the continuance of his original investigations. Lord LILFORD read a most interesting paper on ornithology, and presented to the Northamptonshire Naturalists' Society a large collection of birds, all, with one exception, obtained within the northern limits of the county. A scientific *conversazione* took place on Thursday evening in the Town Hall. Friday was devoted to excursions, one party visiting Castle Ashby and the woods of Yardley Chase in pursuit of botanical and entomological objects; the other, devoted to geology, going in an opposite direction.

— THE TITHE SYSTEM.—A meeting, which was numerously attended by Hop planters, fruit growers, and market gardeners, was held yesterday afternoon at Swanley, in connection with the movement which has been set on foot in Kent to obtain the abolition of extraordinary tithes, and a remission of tithes generally. Mr. THOMAS MAY presided. The members of the deputation who recently waited on the President of the Board of Trade with reference to the farmers' grievances explained the result of their interview, which was considered to be very satisfactory. The meeting was addressed by various speakers, and a resolution was adopted in favour of a modification of the present tithe system and the total abolition of extraordinary tithes.

— FRUIT TREES IN BOHEMIA.—According to recently published statistics, the approximate number of fruit trees in Bohemia, of all sorts, but chiefly Apple, is 14,000,000. Of these 10,000,000 are in gardens, 1,000,000 in waste lands, and about 2,000,000 on the sides of the public roads. The number of young trees annually planted is about 1,500,000. Between 6000 and 7000 miles of road are planted with fruit trees, mostly of the best sorts, and the revenue therefrom is very large. The fruit is largely exported to the North of Germany and Russia.

— THE WEATHER.—General remarks on the weather during the week ending June 21, issued by the Meteorological Office, London:—The weather during this period has been generally fine in Scotland and the extreme north of England, but over the other parts of our islands the sky has been very cloudy, with frequent showers and occasional thunderstorms. The temperature was a little above the mean in Ireland, "Scotland, W.," and "England, N.W.," and equal to it in "Scotland, N.," but elsewhere (though much higher than of late) readings were again below the mean for the time of year. The highest of the minima occurred at our north-western stations, and were registered on the 18th or 19th: on the former day the thermometer rose to 78° at Manchester, and 76° in several other places. The readings were lowest at the commencement of the period, and at Silloth and Markree Castle a minimum was recorded of 37° in the shade. The rainfall was less than the mean in the Scotch districts, and equal to the mean in "England, S.W.," but in all other districts the fall was more than the average. In "England, S.," the excess was rather large. Bright sunshine shows a slight increase in Scotland, but a decrease in nearly all other places. The number of hours recorded varies from sixty-one in "Scotland, W." to about twenty-eight in the central and southern parts of England. The wind was northerly or north-easterly during the first three days, north-easterly to easterly on the 18th, generally easterly on the 19th, south-easterly on the 20th, and southerly (except in the extreme north) on the 21st. In force the wind was light or moderate on most days, but blew strongly along our east coast on the 15th, and reached the force of a gale at Shields and Spurn Head.

## Home Correspondence.

The Gardeners' Royal Benevolent Institute, —Wednesday, July 7 next, should be a memorable day in the annals of the Gardeners' Royal Benevolent Institution—memorable from the fact that His Royal Highness the Duke of Connaught, K.G., will preside. I trust it will be memorable by having the largest subscription list ever obtained. That His Royal Highness will be supported by an influential gathering there is no doubt, and there is every prospect of a success both financially and otherwise. But while the committee are using every endeavour to promote the interests of the Society it is somewhat remarkable that the very class for whose benefit the Society was established do not assist it in the manner they ought to do. Possibly there are many to whom a guinea a-year is a great object, and for these every excuse should be made; but there are a great many of undoubted talent holding high positions in the profession who do not subscribe, and for these there is really no excuse except perhaps that of carelessness, not to say indifference. However, as an appeal is now being made to them by several influential persons, I shall say nothing more on this point, but hope and wait for a good result. My present object in addressing your readers is to say that it is of great importance we should have at our dinner a grand exhibition of fruit, to draw the attention of the company there assembled to what gardeners can do—to show the extent to which the public is indebted to their skill and talent. I hope that this year the gardeners will respond to a solicitation which will be made to them by our secretary to contribute some fruit upon the occasion. That there is abundance of fruit in the country is beyond doubt, witness the displays made at the recent shows at the Horticultural and Botanical Societies. If gardeners can send fruit to these exhibitions in such profusion, surely they can spare a little of it to aid the funds of their own Society. I know that if they would only seek permission from their employers to contribute towards the dessert, that permission would, in most cases, be readily granted; indeed very many employers would be gratified in being able in this way to aid the cause of the Institution. I sincerely trust the gardeners will strengthen the hands of the committee, and to prove that I practise what I preach I shall be happy to set an example by contributing a basket of the very best Grapes in the market, and I hope my example will be extensively followed. One word, in conclusion, to non-subscribing gardeners. "A rainy day" may come, and "a rainy day" does often come, and when distress and penury overtake a subscriber in his old age, the very fact of his having in his best days contributed to assist others, will be the means of his receiving assistance in his turn. *W. H. Gulliford, Member of the Committee.* [We think many of those who cannot subscribe a guinea a year might at least contribute a donation of a shilling, and as much more as they can afford. We shall be happy to receive such subscriptions and to hand them over to the secretary or treasurer of the Society. Eds.]

Sempervivum Disease.—In reference to "W. G. S.'s" note (p. 725), I beg to say I presume, from mention of the Rev. J. E. Vize's name therein, that the specimens of *Endophyllum sempervivi*, stated to have been found at Birmingham in 1879, were some found by me in that year in my garden at Moseley, Worcestershire, 3 miles from Birmingham, and given by me to Mr. Vize. In 1878 I bought a number of *Sedums* and *Sempervivums*. One patch of perhaps nine or ten plants of *S. calcareum*, part of the purchase, I planted on a raised border facing south. These were the plants on which I found the *Endophyllum*. The winter and spring were, as will be remembered, continuously wet. The whole of the plants of *S. calcareum* were affected, and as many of the leaves were almost covered with the fungus it imparted to them a very decided orange hue. The affected leaves were stripped off to prevent the spread of the fungus among my other *Sempervivums*, and were despatched to Mr. Vize through the post, but from a letter I have received from that gentleman to-day I gather they did not reach their destination. Fortunately he had previously received from me a few specimens of this fungus, or the occurrence of it would most probably not have been recorded. I have carefully examined the plants, but do not find the least trace of the *Endophyllum* now visible. *E. W. Badger, Moseley, near Birmingham, June 8.*

A Severe Thunderstorm.—We have had a terrible thunderstorm to-day, which raged for an hour from half-past 12 o'clock. The morning was bright and very hot, when suddenly there came a change, and we had a thorough downpour—first hail, and then rain—such as I have never seen before. The result is, that Brussels sprouts, Beans, Onions, Lettuces, Potatoes, &c., are literally cut to

pieces, and Pea blossoms are strewn thickly on the ground; indeed, things that were promising this morning are now simply a wreck; bedding plants, too, have suffered very much: Coleus and Alternantheras have lost every leaf. *W. Harris, The Gardens, Sulbury Hall, Derby.*

**The Names of Veronics.**—It is to be regretted that curators of botanical gardens, institutions which ought to instruct those wishing to learn, cannot agree to adopt the same name for the same plant. At present any one going to three botanical gardens consecutively, say, for instance, Kew, Cambridge, and Hull, becomes utterly bewildered by the inconsistency of the names he sees given to plants. In no class is this more evident than in the Veronics. This seems to justify nurserymen in sending out what they please under any name. One of these lately told me that when he was serving his apprenticeship at Kew, the curator there told him he would have to learn, not what a plant is, but what it is not. All nurserymen, for example, are ready to supply *V. spicata*, but I confess I am quite ignorant of what *V. spicata* is. I believe *V. virginica* is generally supplied for it. A month ago I sent a piece of a small rockery Veronica, very similar to Mr. Ware's *V. rupestris*, to a distinguished authority in London to be named, and he named it "the true *V. spicata*." The same is sold by Messrs. James Dickson, of Chester, as *V. spicata*. At Kew it is one of the many varieties of *V. Teucrium*. I sent it last week, with others, to the curator of one of our best botanical gardens. He named it *V. pulchella*, adding, "a plant I have grown for years under that name, certainly no relation to *V. spicata*, which seldom flowers before September." The same botanist, in reply to some remarks of mine on the naming of the Veronics at Kew, which I was studying last week, says: "The Veronics undergo strange vicissitudes of nomenclature. At one time these (five varieties sent by me) were all 'prostrata' at Kew, then all 'orientalis,' and now it appears all 'Teucrium.'" Out of some thirty distinct Veronics I cultivate I do not think one third possess a name they can call their own. *C. Wolley Dod, Edge Hall, Malpas, Cheshire.*

**Fig, Dr. Hogg.**—For cultivation and forcing in pots, this variety is indeed invaluable. It is a moderate grower and a free bearer, yielding fruit of medium size, which colours intensely at an advanced season; in fact, it is almost black when fully ripe, and of surpassing excellence. Its merits altogether are such as demand recognition as being worth the notice and attention of those interested in the cultivation and forcing of this excellent kind of fruit in pots. *Geo. Thos. Miles, Wycombe Abbey.*

**Lilium giganteum.**—It may interest "C. W.," as well as many others of your readers, to know that in the gardens of the Rev. W. W. Wingfield, at Gulval, Cornwall, there are several examples of the above beautiful white Lily, the tallest being from 7 to 8 feet high, with a dozen or more flower-buds on it, which will be in bloom in about a week's time. They have withstood the past winter in the open, quite unprotected. *W. Roberts, 9, Chapel Street, Penzance.*

**The Best Time to Cut Down Old Vines.**—I am led to ask for the best available information on this subject through one or two curious instances that have recently been brought under my notice. The cases are these:—Several large Vines were cut down within 6 inches of the root in December last year; the Grapes on those left are now ripe, but the beheaded Vines have given no sign of starting. The roots are outside—protected from the frosts of the past winter and spring—and the heads inside the house. The Vines bled but little, and the stems are quite healthy; but by some means, or rather from some cause, they have failed to push a bud, and the result is no break for an entire season. I prefer taking the opinions of others, assuming that these will be obligingly given in the case as stated, rather than venturing an explanation of my own. I may, however, state that neither bleeding nor root-chilling, nor weakness of the beheaded Vines, will explain the matter. The Vines were quite strong and healthy, and merely removed to prevent overcrowding and produce successful young wood in the house. The contemporary Vines, in all respects similar to the beheaded ones, are now finishing a capital crop, nearly all that could be desired in bunch and berry. The heading of this note will betray an apparent bias on my part to find an explanation in the time of cutting back the Vines, and I would specially wish those who favour me with their views to carefully note that feature of this interesting case. *D. T. Fish.*

**Spring Flowers at Cranbourn Court.**—There are now at Cranbourn Court, Windsor Forest, two beds of spring flowers, Prince of Wales' Feather shape, the finest that have ever come under my notice. They are made up of yellow, white, and blue Pansies, red, white, and pink Daisies, one solid mass of flowers

clearly and artistically arranged; it is almost a sin to pull them to pieces to make room for other summer flowers. I might also mention that there is a large Oak which the gardener (Mr. Bland) has turned into a flower garden, and most attractive it is; for it received thousands of admirers during the Ascot race week, being plainly seen from the high road to Windsor. Mr. Bland has also adopted a plan of suspending baskets well furnished with bright-coloured flowers amongst the large forest trees, which has a very pleasing effect. *S. Johnson, Royal Nurseries, Ascot.*

**Procumbent Broom.**—The other day, in company with its finder, Mr. Charles Howie, Largo, I saw in the grounds of Largo House striking specimens of a drooping variety of our common Broom. Our friend, I believe, found the original a few years ago on Magus Muir, near St. Andrew's, and on sowing seed of it discovered that the greater part retained the trailing habit. It is usual on the lawn to support the centre stem, but on the rockeries it is allowed to assume its natural growth; and in both cases the effect produced by the dense mass of glowing yellow is memorable. For pot culture it is worthy of attention. I have seen it at a few other places, but it by no means has a distribution consistent with its merits. *John Wilson, St. Andrew's, N.B.*

**English Gardeners.**—Mr. Chapman and Mr. Fish have, in my opinion, both gone wide of the mark in stating the grievance of our gardeners of the present day. Mr. Chapman's remarks as to nurserymen's recommendations are quite uncalled for; it is a fact, to which many of our ablest gardeners can testify, that under the system of applying to nurserymen whenever a gentleman required a gardener, the most suitable man on their books at the time obtained the place, in which case it was not only an advantage to employers to receive the better judgment of a practical nurseryman, but also a mutual advantage to nurserymen and gardeners—it so held them together and gave them the means, so to speak, of assisting each other. It was but natural for a nurseryman, after perhaps giving the gardener employment while out of place, and then the assistance of his recommendation, that he should expect the gardener to assist him with any orders he might have at his disposal. Nurserymen cannot, any more than gardeners, live on the air. A gentleman who now requires a gardener generally advertises, and what is the result? He obtains in all probability from one to 150 replies; he is, consequently, in a fix as to choice, and in doing so it becomes not a question of superiority in the man, or of practical knowledge and experience, but one of who has the largest amount of testimonials, or who may be recommended by some personal friend or acquaintance, and in some instances low wages are taken into consideration. Under this system, in nine cases out of ten, the man with least experience, and consequently not suited for the place, gets it; and being unable to manage a place entirely beyond his capacity, he becomes not only a disgrace to himself, but also to the entire profession, his employer becomes disgusted, and having little experience himself, looks upon gardeners as muffs—and certainly not without grave cause, as many men seeking head-gardeners' situations might be better defined under the latter than under the former appellation. Gardening, like most other things, has experienced great changes during the last thirty years; the great facilities at command for travelling, and the great attractions offered in London and elsewhere, naturally draw our aristocracy from their country seats during the greater part of the year. Money cannot be spent both ways, and therefore some one must suffer, and it must be patent to all that the gardener has had to suffer, and more especially the qualified gardener, for in many instances he has had to submit to a decrease of pay or to give place to his inferior, and such will continue to be the case so long as the market is overrun as at the present day. It has often been a matter of great surprise to me that a nobleman or gentleman is content to pay his butler from £60 to £100 per annum, with everything found, and oftentimes his cook as much in proportion, while he has the conscience to offer his gardener £65 and often less, and expect talent at this price. There is an evil somewhere, but I do not consider the importation of German gardeners so great as to cause this evil; depend on it, it lies closer at home than that. *W. W. Mackay.*

**Cold Orchard-houses.**—It is thought by many that these structures are of little value, but I am of a different opinion, although I admit they would be of much more value with sufficient heating to exclude frost. I have under my charge a house 315 feet in length, and this, when shut close, will resist 10° or 12° of frost for several hours; and during the past seasons, when we have had but little fruit outside, inside this house we have had an abundance. It is planted with Figs, Peaches, Nectarines, Plums, Apricots, Cherries, Pears, Roses, &c., and everything this

season is carrying a full crop but Pears: these are planted out, and generally fail. The house is also very useful for forwarding Peas, hardening off bedding plants, storing winter salads, Broccoli, &c. I have seen so-called orchard-houses with a goodly array of fruit trees in pots trained as neatly as specimen flowering plants, with labels as large as one's hand, but never did I see fruit come to full size and perfection in these. I maintain that a good orchard-house should have a good inside border, and a plentiful supply of water; then these may be made to yield a rich harvest with a comparatively small amount of labour. *James Corbitt.*

**The Stopping of Laterals on Grape Vines.**—Though much has been written on this matter it cannot be said to be threshed out, for probably no branch of practice is more important, as certainly none is more varied, than the treatment of laterals. But Mr. Hinds, in search of principles and facts, goes far beyond laterals when he attempts to prove the identical effects on the Vine of these and fruit. Every one admits that fruit, after it fairly emerges from its preliminary stages, draws its supplies from the Vine. It takes all and gives nothing. It feeds on its rich resources and impairs its vital powers. But leaves, no matter where placed, have been held to give strength to rather than take it from the Vine. It is, therefore, new to most of us to be told so authoritatively "that the laterals are to a cultivated Vine what an overflow pipe is to a cistern—they waste a good deal of the vigour of the Vine; but it would be a rash assertion to state that the Vine is none the worse for it." But now I am prepared to go far beyond this in rashness, and affirm that the Vines are probably very much the better for their laterals. But be that as it may, I return to the point I now wish to advert to—the identical effects on the Vine of fruit and branchlets. It will be best to state it in Mr. Hinds' own words, which are at once clear and forcible. After describing the evils of overcropping he asks, "Is it, then, too much to affirm that the Vine that is being drained of its resources by a useless crop of laterals is in any better condition than the one that is being overcropped? It is merely two ways of accomplishing the same end." Then follows the sentence, already quoted, about the overflow pipe, clearly proving that Mr. Hinds considers the functions of Grapes and of laterals identical. But are they not indeed and in truth widely diverse? Have not laterals leaves? Is it not the function of leaves to prepare food to elaborate strength, to recreate and redistribute vital force, to excite and extend the roots, in a word, to build up and enlarge the Vine? If mere wasteful appendages, whereabouts and in what form do they store their waste? We know that the Grapes are exhausting, and we also know what they do with the strength of the Vine—they convert it into the most luscious produce. But if laterals are waste-pipes, who, what, has ever been refreshed by their juice? Mr. Hinds' other illustration is also open to question. Many a young Vine with two shoots will have each of them about as strong as if there were but one. The reason is also obvious. The second and extra shoot quickens and extends the root-power of the Vine to such an extent as to place the two on a level in regard to food supply to the one. If such be the case, and it is, there is no physical nor vital reason why the Vine with two stems should not be able to carry a double load to the one with one. Restrictive pruners seem to ignore to a great extent the rudimentary fact in vegetable physiology, viz., that the action and reaction between bunch and root, top and bottom, is reciprocal; and hence that with each enlargement of the top there is a corresponding extension and enlargement of roots, and a marvellous stimulation and quickening of their activity as well. I also demur to Mr. Hinds' statement about large leaves properly ripened and placed, the larger the better, because size is an element in the measurement of working force: and just as the men with the largest bones and muscles can lift the heaviest weight, so can the largest Vine leaf bring up most sap, and convert most food into produce. In proof of which, if proof is wanted, note the huge nut-brown bud—nut-like in size as well as colour—at its base next autumn-tide, and the size of the bunch it will develop the following spring. *D. T. Fish.*

**Seed Sowing.**—I find in sowing seeds it is of great importance that the surface of the soil should be made firm, as in seasons like the past, with dry east winds blowing almost continually, if the beds are left with ever such a fine surface from the rake, it is not enough—one part of the seed dries up as soon as it has germinated, while another part does not germinate at all; so that a small portion only comes up, and this does not get established so soon as it would were the seed beds made firm. This season I have used the garden roller for almost everything, and I never saw seeds come up so well; every bed is as square as it should be, without a gap to fill up. This is by no means the case everywhere, as I have been the round of several gardens within the last few days, and everywhere I

hear the complaint, "My Beet has come bad," or "My Onions are very thin," or something of that sort. I think much of this would be avoided were the roller passed over as soon as the surface is dry—neither would the birds be able to take the seeds so easily. *J. Corbitt.*

## Reports of Societies.

Royal Horticultural: June 22.

SCIENTIFIC COMMITTEE.—Sir J. D. Hooker, K.C.S.I., in the chair. The meeting was thinly attended, and but few subjects were brought before it.

*Coccus on Acacia*.—Mr. MacLachlan reported that he had examined the specimens referred to him at the last committee, and had consulted M. Signoret upon the matter, with the result that the insect was determined to be a species of *Pulvinaria* allied to that which causes so much injury to the Sugar-cane in Mauritius.

*Malformed Peach Blossom*.—Dr. Masters reported that he had examined the flower submitted to him at the last meeting, and found that it was produced on a stout stalk proceeding from the shoot of the year, a most unusual position in the case of the Peach. The sepals, petals, and stamens were all enlarged and thickened, but otherwise normal. The carpels were two in number.

*Aristolochia unguifolia*.—Dr. Masters reported that the *Aristolochia* referred to him at the previous meeting was a species which he had named a few years since from dried Bornean specimens as *A. unguifolia*. The present specimen was reported to have come from Java.

*Alleged Hybrid Pelargonium*.—Mr. P. Fry, Adlington, sent specimens of a *Pelargonium* with very large proliferous trusses, and which it was supposed had originated as a cross between a Zonal *Pelargonium* and *Geranium pratense*—a view which the committee did not endorse.

*Plants Shown*.—Mr. Bull sent a Lily, referred by Mr. Elwes to *L. columbianum*, and which had the peculiar bulb of *L. Washingtonianum* and the foliage of *L. Humboldtii*. Other plants exhibited were *Trichopilia hymenanthera*, *Bolbophyllum siamense*, *Angraecum* sp., from the Comoro Isles, &c.

The following additions were made to the Lindley Library:—*Index Perfectus ad C. Linnæi Species Plantarum*. Given by Baron von Mueller.—*The British Moss-Flora*. Part I. By Dr. Braithwaite. Purchased.

FLORAL COMMITTEE.—Dr. Denny in the chair. It was a great relief to find but few subjects of any account in the Council-room on this occasion, and no surprise whatever was felt at the smallness of the attendance. First-class Certificates were awarded to Messrs. James Veitch & Sons for *Erythrina marmorata*, a bold and effectively variegated plant, with large brightly mottled leaves, introduced from the South Sea Islands; for *Pteris serrulata cristata bella*, a very prettily crested form; for *Asparagus plumosus nanus*, represented to be a pigmy form of the very handsome plant figured at p. 749, but wanting in distinctness from others already in cultivation. To Mr. William Bull for *Lilium nitidum*, an interesting Lily with a bulb like that of *Washingtonianum*, the habit of growth of *L. Humboldtii*, and the flowers like those of *L. columbianum*, with the important difference, however, that the last named only produces three to six flowers on a plant, while in *L. nitidum* there are a dozen or more. To J. McIntosh, Esq., Duneevan, Oatlands Park, Weybridge, for *Lilium polyphyllum*, a very rare species from the North-Western Himalayas, which has very rarely been seen in flower in this country; the flowers are cream-coloured and spotted with purple; and not particularly striking. To Mr. Turner, Slough, for a fine new white border pink named Mrs. Sinkins, a very full double flower about 2 inches in diameter, very sweet scented, and extremely free-flowering. To Messrs. Hooper & Co., Central Avenue, Covent Garden, for *Canna Ehemanni*, a stately-habited light-green leaved form with rosy-crimson flowers of a larger size than any that we have noticed in this genus before. To Mr. G. Braid, florist, Winchmore Hill, for Decorative *Pelargonium Zulu Belle*, a white flower with a dark maroon blotch on each petal, very distinct, and a smoother flower than many of the market varieties that have been certificated. To M. Victor Lemoine, Nancy, for *Fuchsia Madame Galli Marie*, a vigorous habited and free blooming variety with the tube and sepals scarlet, and the full double corolla white—a fine exhibition variety. Messrs. Veitch & Sons also exhibited a couple of well-flowered plants of *Platycodon grandiflorum*, a very fine old herbaceous plant, about 12 inches high, with large, open, bell-shaped, deep blue flowers. Mr. B. S. Williams sent four new Orchids, viz., *Trichopilia hymenanthera*, with a short spike of six flowers, which have a bold scoop-shaped lip, white, and prettily spotted, and narrow sepals and petals; *Angraecum Scottianum*, a singular and very rare species, this being one of two plants only

that are known to be in the country. The plant has the habit and foliage of *Vanda teres*, while the flowers are white. It comes from the Comoro Islands; *Bolbophyllum siamense*, a large orange-coloured flower with a movable lip; and *Cyclogyne corymbosa*. Mr. Williams also showed *Oleobachia palustris*, an elegant greenhouse plant, resembling *Aralia Veitchii*, but having dark green digitate leaves, and apparently allied to *Delabachia*. Mr. Fry, the Gardens, Adlington Park, exhibited several Zonal *Pelargoniums*, with immense proliferous trusses of flowers. The proliferous tendency, which hitherto has only appeared at intervals as a freak of Nature, appears in this case to have been quite fixed, so that when the flowers have been improved in quality a most useful set of plants for cutting from may be forthcoming.

FRUIT COMMITTEE.—H. Webb, Esq., in the chair. Mr. Marriott, Campbell's Creek Nursery, Castlemaine, Victoria, contributed a very handsome sample of Sturmer Pippin Apples grown in Australia; also two dishes of a large and very showy variety wrongly named Gloria Mundi, and more closely resembling Waltham Abbey Seedling. The flavour in both cases was excellent, and especially so as regards the former. From Mr. T. H. Sutton, gr., Worksop Manor, came a very good Black Prince Pine, weighing about 6 lb.; and Mr. Woodbridge brought up from Syon a nice sample of the Early Cluster Tomato, a seedling variation of the old Pear-shaped variety, with small deep red fruits. A heavily netted green-fleshed seedling Melon was shown by Mr. A. Hopkins, gr. to R. Johnson, Esq., Remnal Manor, Chislehurst, but it proved when cut to be deficient in flavour. The High Cross Hybrid Melon, which was certificated last week at Regent's Park, was shown to-day by Mr. James Hopkins, gr. to R. Thornton, Esq., but it failed to get an award, though of much better quality than many that have been submitted to the judgment of the committee. Mr. R. Dean again submitted samples of his new seedling Potato, The Cluster, which has very dwarf foliage, and handsome pebble-shaped, medium-sized tubers.

**Pelargonium Society.**—This Society awarded First-class Certificates to four varieties raised by M. Lemoine, of Nancy, which were shown at the meeting of the Floral Committee on Tuesday, having been grown by Mr. Barron at Chiswick. These were *Pelargonium* (Decorative) *Madame Thibault*, a distinct and most attractive semi-double white flower heavily shaded with bright rose-pink. *Pelargonium* (Decorative) No. 108, a very pleasing flower, white with a dark maroon blotch on the upper petals, and a rose-coloured spot on the lower ones—a very neat flower, and the plant a sturdy grower. *Pelargonium* (Ivy-leaved) *Gloire d'Orléans*, a very fine double of a lustrous rosy-magenta shade of colour, and a remarkably bushy free-blooming habit; and *Pelargonium Mons. Dubus*, an equally fine double flower, but very bright pinkish-rose in colour.

**York Gala: June 16, 17, and 18.**—This show was held on the above days at the old grounds, Bootham, and collectively was a great success, although here, as in most other places at the present day, stove and greenhouse flowering plants were fewer in number, and, with some exceptions, not equal in quality to what they were some years back. Finely grown and flowered as *Pelargoniums* have so long been seen here, this year's display quite outstripped anything that has preceded it for the even excellence of the immense number shown. This remark applies to the Show varieties, the Fancies, the Zonals, as also to the Bicolor and Tricolor sections, which collectively were forthcoming in such condition and quantity as sufficed to fill the large tent devoted to them, and in themselves they were an exhibition worth going some distance to see. The herbaceous and alpine plants as now exhibited at York, in both numbers and condition go to fairly represent this important department of gardening, and combined with the bedding plants, grown and shown as they are here in large pans in the best possible order, they form a feature that we do not meet with elsewhere.

The leading feature of the show was the groups of miscellaneous plants staged for effect, each occupying a space not exceeding 200 square feet. There were five competitors, and the 1st prize group, shown by Mr. Letts, gr. to the Earl of Zetland, Upleatham, Marske-by-the-Sea, was composed of elegant Palms, Ferns, variegated Pines, *Dracænas*, and *Caladiums*, mostly in small pots, except the large, tall examples, which were used to stand out in relief with just sufficient small flowering plants to give the required amount of colour; the whole was edged with *Panicum variegatum*, *Adiantums*, and small examples of *Pandanus Veitchii*. The 2d prize went to a very nicely arranged group shown by Mr. R. Simpson, Selby, much in advance of what is usually met with in the provinces; the back was made up of Palms, Ferns, and *Dracænas*, with mixed flowering and small foliage plants in front. The 3d and 4th prizes went respectively to Mr. Berry, gr. to W. Dove, Esq., York, and Mr. Stephenson, gr. to Mr. Alderman Walker.

STOVE AND GREENHOUSE FLOWERING PLANTS.—Messrs. Cole, Withington, Manchester, were the only

exhibitors of twelve, and took the 1st prize. In the class for six Mr. Letts was well 1st, with much the best specimens in the exhibition—large and finely flowered, with plenty of fresh green foliage down to the pots. The collection consisted of an immense *Stephanotis floribunda*, quite 5 feet through, bearing a quantity of very large trusses of flower; *Ixora coccinea*, equally large and well bloomed; a grand *Azalea Brilliant*, *Erica tricolor elegans*, *Anturium Scherzerianum*, and *Ixora Williamsii*. With three Mr. Letts was also easily 1st, showing *Allamanda grandiflora*, trained bush-fashion; *Erica insignis*, and *Dracophyllum gracile*, all well flowered. Mr. Wright, gr. to G. Talbot, Esq., Leeds, was 2d.

FINE-FOLIAGE PLANTS.—These were very well shown by Mr. Letts and Messrs. Cole, who took the prizes in the principal class for eight in the order of their names. Mr. Letts' plants were remarkably fresh and bright looking. *Croton majesticus*, *C. Johannis*, and *C. Weissmanni*, all splendidly coloured; *Gleichenia rupestris glaucescens*, *G. Mendelli*, the latter 6 feet through, and in such extraordinarily fine condition as we have not before seen it; a good *Cycas revoluta*, *Chamaerops humilis elegans*, and *Dasyliroium plumosum*, a splendid specimen. Messrs. Cole's plants were also large and fine; they comprised Palms, in which *Cocos Weddelliana* and *Kentia Fosteriana* were beautiful examples; *Croton Dasraeh*, nicely coloured; *C. angustifolius*, and others. For four fine-foliage plants Mr. Winterburne, gr. to T. Simpson, Esq., Weetwood, was 1st with a good group, in which there was a finely grown *Eucaphalartos villosus*, over 10 feet through.

ORCHIDS.—These were not so numerous shown as we have seen them at York. For six, Mr. Mitchell, gr. to Dr. Ainsworth, Broughton, Manchester, took the lead with a nice lot, consisting of *Thunia Bensoniae*, *Aerides Daymum*, *Odontoglossum Pescatorei*, *Calanthe veratrifolia*, a very large mass of *Phalenopsis Ludde-manniana*, and *Cypripedium barbatum*; 2d, Mr. Hayward, gr. to Captain Hucks, Breckonbro', near Thirsk, his best plants being *Odontoglossum cirrosus* and *Lelia purpurata*. With three, Mr. Mitchell was also 1st, showing a beautiful plant of *Arrides Lobbi*, an equally fine *Epidendrum vitellinum majus*, bearing some thirty spikes of very large finely coloured flowers; and *Cattleya Mendelli*; 2d, Mr. Hayward, in whose collection was a good form of *Odontoglossum vexillarium*.

FERNS.—In the class for eight stove and greenhouse varieties Messrs. Cole were 1st, with a nice even lot, containing good healthy plants of *Brainea insignis*, *Davallia Mooreana*, *Gleichenia rupestris*, *Thamnopteris australasica*, and *Cibotium Schiedei*; 2d, Mr. Berry, having amongst others a couple of fine tree species—*Cyathea medullaris*, and *Dicksonia antarctica*. With four, Mr. Letts took the 1st prize, showing clean, well-grown plants of *Davallia bullata*, *Pteris scaberula*, *Gleichenia Spelunca*, and *Gymnogramma sulphurea*; 2d, Mr. A. Scott, York. Hardy Ferns were in great force, several of the collections being so evenly balanced as to make it difficult to decide between the competitors. For twelve, Mr. A. Scott occupied the post of honour with a group all good. He had beautiful plants of *Trichomanes Andrewsii*, *Osmunda regalis cristata*, *Hymenophyllum Wilsoni*, *Adiantum Capillus-Veneris*, and various large examples of *Athyrium*, *Polystichum* and *Lastrea*. Mr. C. Rylance, Bold Lane Nursery, Aughton, was a very close 2d; and Mr. J. Rodwell, Burton Lane, York, 3d, with smaller but well-grown plants. With six varieties Mr. W. R. Robinson, York, came in 1st, having a fine half-dozen, in which was a grand plant of *Polypodium* (vulgare) *elegantissimum* var. *Stanfieldii*. Of thirty-six varieties, in not more than 6-inch pots, there were four exhibitors, running each other very close; Mr. Rodwell, however, took the 1st with a well-assorted collection; Mr. A. Scott being 2d, and Mr. W. R. Robinson 3d. For *Lycopodium* Mr. Berry was 1st with a very fine half-dozen, in which *L. Willdenowii*, *L. viticulosum*, and *L. Levigata arborea* were unusually good; 2d, Mr. Stephenson, showing well-grown plants, but the varieties not equal to the 1st prize lot.

PELARGONIUMS AND FUCHSIAS.—Mr. Rylance was well 1st with twelve Show varieties, his plants reminding us of the days when Turner, Bulky, and Ward used to come out at the London shows in their best form; his finest examples were of *Queen Bess*, *Brigitante*, *Madame Hilaire*, *Prince Leopold*, *Mrs. Bradshaw*, *Empress*, and *Kingston Beauty*. Messrs. Lazenby & Sons, York, who were 2d, also had a fine lot, most noticeable in which were *Duchess of Edinburgh*, *Queen Bess*, *Digby Grand*, and *Claribel*. Mr. May, Hope Nursery, Bedale, was 3d, and Mr. Eastwood, gr. to F. W. Tetley, Esq., Weetwood, Leeds, whose group was also really well done, was awarded an extra prize. For six show varieties Mr. McIntosh, gr. to J. T. Hingston, Esq., Clifton, Yorkshire, was 1st with plants a little smaller than some shown, but quite equal in other respects; 2d, Mr. Eastwood, who was 1st for three show varieties. The Fancy kinds were not so numerous represented, but Mr. Rylance's half-dozen were fully as good as used to be seen in years past at the best exhibitions of these plants, being large and completely clothed with blossoms. Mr. Eastwood, with smaller but well-flowered examples, was 2d. Zonal and Nosegay varieties were well shown, and with twelve varieties Mr. Stephenson was placed 1st, having plants with large flowers, but deficient in foliage; Mr. McIntosh came in 2d, and Messrs. Lazenby 3d. For six Mr. Winterburne was 1st, with a large and finely flowered lot, in which Mrs. W. Paul and Grand Duke were extremely good; 2d, Mr. Eastwood. Bronze *Pelargoniums* were shown in such order as few have seen them, 1st for six was Mr. Barnes, gr. to Mrs. Jackson, Poekington, with immense well-furnished specimens, finely coloured; 2d, Mr. Clarke, gr. to Miss Wharton, York. With *Tricolors* there was an extensive

and good competition, Mr. Barnes again coming in 1st, with large and well-finished specimens. Fuchsias were well flowered, the plants large, but mostly a little too closely trained. Mr. Clarke was 1st, with an even six, mostly old-established varieties; and Mr. McIntosh 2d.

**HERBACEOUS CALCEOLARIAS, &c.**, were represented by the old-fashioned Yorkshire strain—well formed, handsomely marked flowers, but not equal in habit or strength of constitution to the best as now seen in the South. Mr. Gowthorpe, gr. to Miss Steward, Bishopthorpe, was 1st for eight varieties, and Mr. Berry 2d, both showing nicely grown plants with bright blooms. A very fine group of seedling Gloxinias, some thirty varieties, were contributed by the Rev. G. E. Gardner, Heworth, York; they received an extra prize. Some seedling Gloxinias were also shown by Mr. Clayton, gr. to J. Fielden, Esq., Grimston Park, Tadcaster, amongst which were three of the most distinct, finely marked, and largest flowered varieties we have seen.

**BEDDING PLANTS**, shown in large pans, as we have already said, are extremely effective, and brought out as they are here make a telling display. For sixteen distinct kinds, excluding Pelargoniums, Mr. R. Simpson had the premier award, his most noticeable examples being *Nierenbergia gracilis*, *Coprosma Baueriana variegata*, *Lobelia Ebor.*, *Sedum aizoides variegatum*, *Alternanthera versicolor*, and *Ophiopogon spicatus aurovariegatus*; 2d, Mr. A. Simpson, Heworth Nurseries; 3d, Mr. Stephenson.

**ROSES AND CUT FLOWERS.**—To those who are in the habit of seeing the immense specimens of pot Roses shown at the metropolitan exhibitions, those that are met with at York look small, but nevertheless they are very well managed, clothed with healthy stout foliage, and bear a full complement of fine flowers. In the class for six plants, distinct varieties (open), Messrs. Pybus & Son, Monkton Moor, Ripon, took 1st; Messrs. Jackson & Co., Bedale, 2d; and Mr. May, 3d. For nine varieties, in 8-inch pots, the prizes went to the same exhibitors, in the same order. For fifteen varieties, in 8-inch pots, Messrs. Jackson & Co. occupied the post of honour, Mr. May coming in 2d, and Messrs. Pybus 3d. For forty-eight single blooms (open) Mr. May was 1st, as also for thirty-six single blooms Messrs. Jackson being 2d. For twenty-four Mr. May was again 1st, Messrs. Jackson 2d, and Mr. Eastwood 3d. With twelve white and yellow Roses (amateurs) Mr. E. R. Whitwell, Darlington, took 1st; Mr. Eastwood 2d. Twelve Tea-scented Roses, one variety; 1st, Mr. E. R. Whitwell; 2d, Mr. Swann, gr. to Col. Brooshoote, Hull. For eighteen distinct varieties, twelve ditto, and twelve hybrid perpetuals, Mr. Eastwood was 1st. For twelve bunches of stove and greenhouse flowers, Mr. McIndoe, The Gardens, Hutton Hall, Guisborough, was 1st, with a very fine lot composed of *Ixoras*, *Anthurium Scherzerianum*, *Heaths*, *Tabernaemontana coronaria flore-pleno*, &c. Messrs. Cole were 2d, showing, as they usually do, a good box. Twenty bunches hardy flowers: with these Mr. McIndoe was again to the front, his best kinds being *Dodecatheon Jeffreyanum*, *Anthericum Hookerii*, *Verbascum phoeniceum purpureum*, &c.

**FRUIT** was well represented generally, both as to quantity and quality. In the class for ten dishes Mr. McIndoe was easily 1st, with an even lot, consisting of very well finished Muscat of Alexandria and Black Hamburg Grapes, Smooth Cayenne and Queen Pines, Alexandra, Noblesse, and Bellegarde Peaches, Violette Hâtive Nectarines, Brown Turkey Figs, and a couple of Melons, all nicely staged. Mr. Clark, gr. to the Marquis of Ripon, Studley Royal, came in 2d, showing amongst others a very fine dish of Castle Kennedy Figs, very large James Veitch Strawberries, well coloured Violette Hâtive Nectarines, and Black Hamburg Grapes. For six dishes Mr. McIndoe was also 1st; his Grapes, both Muscats and Black Hamburgs, were better in this class than in the first one; he had also in this collection a good Queen Pine. Mr. Clayton was a very close 2d, with a good Queen Pine, Muscat of Alexandria and Black Hamburg Grapes, nice bunches and good berries, but a little short in colour; and good dishes of Peaches, Nectarines, and Figs. Mr. Clark was 3d, the best in his collection being Castle Kennedy Figs, very nice Black Hamburg Grapes, and Dr. Hogg Peaches. For four dishes Mr. McIndoe again came in 1st, thus making a sweep of all three collections: his exhibits were similar to those shown in the preceding classes. Mr. Woods, gr. to A. Wilson, Esq., Tranby Croft, near Hull, was 2d, with beautifully coloured Violette Hâtive Nectarines, a good dish of Royal George Peaches, well coloured Black Hamburg Grapes, and a fine Melon. With two bunches of black Grapes Mr. Wallis, gr. to Sir H. Meysey-Thompson, Kirby Hall, York, was 1st, showing good bunches of extremely well-finished fruit; 2d, Mr. McIndoe. In the corresponding class for white Grapes, Mr. Wallis and Mr. McIndoe were placed equal 1st, the former having small but beautifully coloured Muscat of Alexandria, the latter very good Buckland Sweetwater. In a class for any new variety, two bunches, Mr. McIndoe was 1st, with small bunches containing some large berries of Duke of Buccleuch; Mr. Wallis was 2d for Royal Ascot. With good Queen Pines Mr. Clayton was 1st, and Mr. Letts 2d; and Mr. Coleman, gr. to Earl Somers, Eastnor Castle, took 1st, with a large and finely coloured dish of Nectarines; Mr. Miles, gr. to Lord Carington, High Wycombe, being 2d, with smaller but well coloured fruit. For Peaches Mr. Wallis had 1st, staging a fine dish of Grosse Mignonne; Mr. Coleman 2d, having equally good fruit of the same variety. In the class for green-fleshed Melons Mr. Coleman was 1st, Mr. Clark 2d. With a scarlet-fleshed Melon Mr. Clark took 1st, Mr. McIndoe 2d. In Figs Mr. Clark was 1st, with a fine dish of Castle Kennedy;

Mr. McIndoe 2d. Strawberries were remarkably well represented. Mr. Chuck, gr. to C. S. A. Thelluson, Esq., Doncaster, was 1st, with a magnificent dish of President, very large and splendidly coloured; Mr. Clark, who was 2d, had very good James Veitch. Mr. McIndoe was 1st for Cherries, with May Duke.

We are glad to learn that the show was a complete success financially, about 45,000 persons having paid for admission during the three days it was open. As compared with last year the receipts show an excess of about £120.

**The Scottish Pansy: June 18.**—This Society held its thirty-sixth annual competition in Edinburgh on Friday, the 18th inst., and from whatever point of view it is looked at it may be taken as the most successful show ever held. In point of numbers there were 274 stands, being more than double the number one has been accustomed to see. The prize-list proves that this is a thoroughly national Society, as the competitors were from all parts of the country. The public might naturally think that there must be a great sameness and want of variety in a Pansy show, but this is certainly not the case, as any one must admit on seeing the wonderfully brilliant and varied colours of the Fancy Pansies intermixed with the quieter shades of those known as show Pansies; whilst the tables set apart for lady competitors—to whom prizes are offered for the most artistically arranged table-glasses and bouquets of bedding Violas—were exceedingly attractive, and were much admired by all the visitors. The quality of the Fancy Pansies was greatly in advance of those exhibited at any previous show, and the unusually large number of blooms of this class tabled separately for the opinion of the judges, shows that the taste for them is on the increase amongst amateurs and gardeners as well as nurserymen. We were glad to learn that the funds of this old Society are in a very satisfactory condition, so that the sister societies that have sprung up in different parts of the country are increasing rather than diminishing the success of the national society. Most of the prizes were largely competed for, while the quality of the flowers was so equal that the Judges had great difficulty in coming to a decision, so that it was no disgrace to those who were unsuccessful.

The following First-class Certificates were granted:—To Messrs. Downie & Laird, Edinburgh, for Fancy Pansies, Robert Laird, L. Y. Heathcote, and R. K. Mitchell; to Messrs. Dicksons & Co., Edinburgh, for Fancy Pansies, Perfection, Miss Duncan, and Mrs. W. M. Welsh. Certificates of Merit were awarded to Mrs. Taylor, Corstorphine, for Fancy Pansies, Minnie Nicoll, and Mrs. Mitchell; and to Mr. George Ross, Laurencekirk, for Fancy Pansies, J. C. Findlater and Mrs. D. L. Whittou.

To show how widely the prizes were divided, we annex the numbers taken by some. Mr. Borrowman, Beeslack, having gained sixteen prizes, carried off the Medal, as he did last year; Mr. Ross, Laurencekirk, gained fourteen prizes; Dicksons & Co. took thirteen prizes; Mr. Skinner, Penicuik, seven; Mr. Fleming, Berwick, six; Mr. Paul, Paisley, five; Mr. Forbes, Rosshalt, five; Mr. Thomson, Rothesay, four; Mr. Findlay, Lennox Castle, three; Messrs. Downie & Laird, three; Mr. McComb, Montrose, three; Mr. Cuthbertson, Corstorphine, three; Mr. Cocker, Aberdeen, two. Amongst the ladies' classes for the arrangements of bedding Violas it was gratifying to see the great amount of interest taken by the public in the very tasteful and pleasing effect produced by these easily cultivated flowers, the more so as they can be grown by every one in town or country however small their gardens may be. When made up with Fern fronds or other light green, the effect is charming, and this Society ought to feel indebted to the ladies who so successfully showed how much can be made of these flowers. Miss Owen, Knockmullen, Gorey, Ireland, took 1st honours for the table glass, Mrs. Guthrie taking the 2d prize. Miss Lorimer was 1st for the bouquet of Pansies or Violas. Mrs. W. Welsh was 1st for six most tasteful bunches of Violas; Miss Fleming 1st for six Show and six Fancy Pansies.

**Chertsey and District Horticultural.**—The summer exhibition of this Society was held in the grounds of Ashley Park, Walton-on-Thames, by the kind permission of Mrs. Sassoon, on Thursday, June 17. The Society is well supported by the gentry of the neighbourhood, the exhibits in most cases being very creditable to the gardeners. Groups of plants arranged for effect form a principal feature, and one tent was devoted to this. Two sets of prizes were offered: the largest group was 7 feet by 14 feet. Mr. Cornhill, Oatlands Park, gained the 1st prize easily; his plants were not only well arranged but they were also well grown. The front line was formed of neat little plants of Harrison's Musk and small plants of different species of Lycopod; the second line mostly of Maiden-hair Ferns and Gloxinias, while Palms, broad-leaved Crotons, and flowering plants formed a background. The other exhibitors were a good way behind, but their groups were very creditable. In the smaller groups, Mrs. H. Cobbett, York Lodge, Walton-on-Thames (Mr. A. Millican, gr.), gained the highest award, but all the exhibitors in this class arranged their plants so that the pots were too much seen. The best flowering stove and greenhouse plants were from Mr. Cornhill; his group contained a good *Bougainvillea glabra* and a fair specimen of *Darwinia tulipifera*. The collection from H. Rogers, Esq., Oatlands Park (W. Polley, gr.), was very nearly as good, and it contained a very good *Anthurium Scherzerianum*. Mr. Cornhill, also gained the 1st prize in foliage plants: the best was a very fine example of *Bonapartea juncea*; besides this there was a good *Dicksonia antarctica*, and a nice plant of *Cocos Weddelliana*. The same exhibitor

had a 1st prize for half a dozen very fine Gloxinias; the size and quality of the flowers were all that could be desired—as many as a score of them on one plant. Mr. A. Millican exhibited the best hardy and British Ferns, and very fine they were—*Trichomanes radicans* in splendid masses, also well grown examples of the Lady Fern and Hart's-tongue. The same exhibitor deservedly obtained a 1st prize for six excellent pans of Lycopodiums. Lilliums were well represented from the gardens of James McIntosh, Esq., Oatlands Park (Mr. Taylor, gr.); they were very well grown plants, and comprised *L. purpureum*, *L. Hansonii* (two very fine examples), *L. parvum*, and varieties of *L. Thunbergianum*. The best twelve plants for the table came from A. Gillespie, Esq., Weybridge (Mr. Povey, gr.); the same exhibitor held a similar position for some well grown Fuchsias: they were well furnished with flowers, and the lower branches drooped over the pots as they ought to do. Mr. Povey gained a 1st prize also for cut flowers; his stand contained a number of Orchids, and amongst others the rather difficult-to-manage *Epidendrum bicornutum*. There were excellent collections of Ferns, *Petunias*, *Pelargoniums*, *Caladiums*, &c., but none of them of very remarkable quality, and the Roses were scarcely up to the mark. There was fairly good fruit. The best black and also the best white Grapes were from the garden of J. W. Wilson, Esq., Weybridge (Mr. Russell, gr.). Mr. Taylor had the best Strawberries, British Queen, while Mr. Cornhill showed good Peaches and Nectarines, gaining the 1st prize in each instance. Mr. Russell had the best green-fleshed Melon, and Mr. Millican the best scarlet-flesh. A number of very good baskets of vegetables were exhibited, Mr. Cornhill's being the best of them. The same exhibitor was 1st in a good competition of Cucumbers, the variety being Tender and True. The cottagers exhibited good fruit, although but little of it was ripe; good vegetables, such as Cabbages and Potatoes; also a few flowers in pots.

The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, JUNE 23, 1880.

- June 17.—A dull cloudy day. Warmer. Occasional showers in morning.
- 18.—A very fine day. Warm. Clear. Strong breeze. Dull with rain after 10 P.M.
- 19.—Dull and showery till 11 A.M. Very fine and bright afterwards. Overcast at midnight.
- 20.—A fine day, generally cloudy. Warm. Rain fell in early morning.
- 21.—A fine bright warm day. Partially cloudy. Overcast at night.
- 22.—Overcast, dull throughout. Frequent rain. Cooler.
- 23.—Generally fine, though cloudy. Occasional rain in afternoon. Cool.

**LONDON: Barometer.**—During the week ending Saturday, June 19, in the vicinity of the Metropolis the reading of the barometer at the level of the sea increased from 30.05 inches at the beginning of the week to 30.09 inches by the evening of the 14th; decreased to 29.92 inches by the morning of the 16th; increased to 30.14 inches by the morning of the 17th; and decreased to 29.69 inches by the end of the week. The mean reading for the week at sea level was 29.99 inches, being 0.14 inch above that of the preceding week, and 0.02 inch above the average.

**Temperature.**—The highest temperatures of the air observed by day varied from 75¼° on the 18th, and 74° on the 13th, to 57¼° on the 15th; the mean value for the week was 68°. The lowest temperatures of the air observed by night varied from 46° on the 13th to 53¼° on the 19th; the mean value for the week was 49¾°. The mean daily range of temperature in the week was 18¼°, the greatest range in the day being 29°, on the 18th, and the least 7¼°, on the 15th.

The mean daily temperatures of the air and the departures from their respective averages were as follows:—13th, 58°.2, -0°.5; 14th, 57°, -1°.9;

15th, 52°.3, -6°.7; 16th, 52°.8, -6°.3; 17th, 57°.2, -2°.1; 18th, 61°.7, x 2°.2; 19th, 60°.8, x 1°. The mean temperature of the air for the week was 57°.4, being 2° below the average of sixty years' observations.

The highest readings of a thermometer with blackened bulb in vacuo, placed in the sun's rays, were 147° on the 13th, 154° on the 18th, and 148° on the 19th; on the 16th the reading did not rise above 63°. The lowest readings of a thermometer on grass, with its bulb exposed to the sky, were 49° on the 10th, and about 43° on the 14th, 17th, and 18th; the mean of the seven lowest readings was 45½°.

Wind.—The direction of the wind was variable, and its strength gentle.

The weather until Friday was generally dull, cold, and showery, but fine, bright, and warm afterwards.

Rain fell on five days; the amount measured was 0.96 inch.

ENGLAND: Temperature.—During the week ending Saturday, June 19, the highest temperatures of the air observed by day were above 78° at London, Cambridge, Birmingham, and Nottingham, and below 71° at Truro, Plymouth, Leeds and Sunderland; the mean value from all stations was 73½°. The lowest temperatures of the air observed by night were below 45° at Brighton, Cambridge, Norwich, Nottingham, and Hull; and above 50° at Plymouth, Bristol, and Liverpool; the general mean from all places was 47½°. The extreme range of temperature in the week was above 32° at London, Cambridge, and Nottingham, and below 22° at Plymouth and Sunderland; the mean range of temperature from all stations was 26½°.

The mean of the seven high day temperatures was above 68° at Brighton, Cambridge, Norwich, Birmingham, and Nottingham, and below 64° at Sheffield, Hull, and Sunderland; the general mean from all places was 66¼°. The mean of the seven low night temperatures was below 50° at London, Wolverhampton, Nottingham, and Hull, and above 53° at Truro and Plymouth; the mean value from all stations was 51¼°. The mean daily range of temperature in the week was above 20° at Cambridge and Nottingham, and below 12° at Truro, Plymouth, Liverpool and Sunderland; the mean daily range from all places was 15°.

The mean temperature of the air for the week from all stations was 57°, being ½° lower than the value for the corresponding week in 1879. The mean temperature was above 58° at Brighton, Cambridge, Norwich, and Birmingham, and below 55½° at Wolverhampton, Sheffield, Hull, and Sunderland.

Rain.—The amounts of rain measured varied from 0.96 inch at London, 0.88 inch at Hull, and 0.80 inch at Liverpool, to 0.17 inch at Leeds and 0.30 inch at Birmingham; the average fall over the country was 0.55 inch.

The weather during the week was generally dull, cold, and showery, though fine at times.

A thunderstorm occurred at Liverpool on the 19th inst.

SCOTLAND: Temperature.—During the week ending Saturday, June 19, the highest temperatures of the air varied from 73° at Dundee to 64° at Leith; the mean value from all places was 69¼°. The lowest temperatures of the air varied from 41° at Paisley to 47½° at Edinburgh; the general mean from all stations was 44¼°. The mean range of temperature in the week from all places was 25½°.

The mean temperature of the air for the week from all stations was 57½°, being 1½° higher than the value for the corresponding week in 1879. The mean temperature was above 59° at Dundee, and below 55½° at Leith.

Rain.—The amounts of rain measured during the week were the heaviest at Edinburgh, 0.61 inch, and Leith, 0.52 inch; and the least at Paisley, 0.03 inch. At Greenock no rain was measured; the average fall over the country was a quarter of an inch.

DUBLIN.—The highest temperature of the air was 66¼°, the lowest 41¼°, the extreme range 24½°, the mean 56½°, and the fall of rain 0.10 inch.

JAMES GLAISHER, F.R.S.

Enquiries.

He that questioneth much shall learn much.—BACON.

INDIAN PLANTS.—I have received some seeds from Poonah with names that I do not understand. Can you kindly give me their botanic names?—1, Red Bargie; 2, Soap Nut [Sapindus emarginatus]; 3, Sominden Soke; 4, Gold Mohur. Henry Stevens.

Answers to Correspondents.

BEGONIAS: E. Fornachon. Yours is a very fine strain of flowers, but they are too much like those already known to be of any great commercial value. For home decoration they are perhaps equal to any, as they seem to possess vigour of habit.

BEGONIAS FOR BEDDING: A. B. Pystock. The tuberous-rooted sorts generally will do very well bedded out. The earlier varieties of the Sedeni type are especially adapted for this purpose, but we believe any of them may be used. They should be started in gentle heat, hardened off, and then planted out as soon as weather permits like other half-tender bedding subjects. A partially shaded and sheltered situation is best for them.

COLUMBINES: C. H. D. The flowers had unfortunately fallen to pieces before they reached us.

COMPETITION AT EXHIBITIONS: "S." asks if in a flower show the gardener and under gardener are ever allowed to compete from the same garden for a prize in the same class? Certainly not.

DAHLIA: J. C. M. Your double-faced Dahlia is simply due to the union of two stalks. It is not uncommon.

EASTER: Almonac, who has to provide a supply of fruit of a certain kind at Easter, is informed that that event falls during the next five years as follows:—1881, April 17; 1882, April 9; 1883, March 25; 1884, April 13; 1885, April 5.

FUCHSIAS: R. P. H. They are large in size, but possess no other merit. We cannot say what their names may be.

GALL ON RHODODENDRON: C. E. H. The excrescence is due to the attack of a fungus (Exobasidium Rhododendri). We advise you to burn the affected plants. It is Rhododendron ferrugineum, not an Azalea.

IVY ON TREES: Subscriber. The Ivy will probably kill the Oak trees in time, but the process is sometimes a slow one. However, if the timber of the Oak is preferred to the picturesque character of the Ivy, by all means have it removed; it will certainly do the Oak no good.

MONOGRAPHS: C. H. D. No.

NAMES OF PLANTS: R. L. 1, Athyrium Filix-foemina rhaeticum; 2, Lastrea Filix-mas cristata; 3, Woodwardia radicans; 4, Woodwardia orientalis. Neither of the Ferns you mention are hardy; they require greenhouse treatment.—D. J. Nephrolepis tuberosa.—O. H. Philadelphus mexicanus.—T. H. balding. Polemonium coeruleum, white variety; 2, Tradescantia virginica; 3, Geranium sanguineum; 4, Lastrea Filix-mas.—D. C. P. Verbasicum blattaria.—J. Macdonald, Faldfield. 1, Origanum Dictamnus; 2, Crucianella stylosa; 3, Verbasicum phoeniceum; 4, Sedum kanschaticum; 5, Statice armeria, white variety; 6, Abutilon vexillarium.—Inquirer. 1, Arides odoratum; 2, Vanda Roxburghii.—J. H. Crookbank. 1, Centaurea montana; 2, a Verbasicum, not recognised, possibly a mule; 3, Spiræa hypericifolia; 4, Daboecia polifolia; 5, Anchusa sempervirens; 6, Potentilla tridentata.—James Cocker & Son. Thermopsis fabacea.

PANSIES: J. C. & Co. A strain of large, brightly coloured, and consequently very showy fancy Pansies for border cultivation, but certainly not equal to the finest Scotch strains as show flowers.

SHRUBS UNDER TREES: A. B. There is nothing evergreen so good as Ivy for planting under the shade of large trees. Hypericum calycinum is useful for the same purpose.

TANNER'S BARK: A. B. This has not much value as a dressing, but is sometimes useful on heavy soils to assist in lightening them. It would be much more beneficial if charred before being used, that is, "smother-burned" in a heap in the same way as ballast.

VALUATION: A. B. No doubt the landlord, in valuing such things as you mention, acts well within his rights; but it is for you to consider whether it will pay you to accept his terms. If you do take possession of the land on the terms mentioned, you should protect yourself by stipulating that the same things shall be valued when you give it up, to make the bargain a fair one between both parties.

FOREIGN SUBSCRIBERS sending Post-office Orders are requested to make them payable at the post-office, King Street, Covent Garden, London, and at the same time to inform the Publisher at the office of this Journal.

Markets.

COVENT GARDEN, June 24.

Business remains much the same as last week, with a large supply of good Strawberries from Southampton, which are making good prices. James Webber, Wholesale Apple Market.

FRUIT.—RETAIL PRICES.

Table with 3 columns: Fruit, Price (s. d. s. d.), and Fruit, Price (s. d. s. d.). Includes items like Apricots, Cherries, Cob Nuts, Gooseberries, Grapes, Lemons, Melons, Oranges, Peaches, Pine-apples, and Strawberries.

VEGETABLES.—RETAIL PRICES.

Table with 3 columns: Vegetable, Price (s. d. s. d.), and Vegetable, Price (s. d. s. d.). Includes items like Asparagus, Beans, Beet, Cabbages, Carrots, Cauliflowers, Celery, Chilis, Cucumbers, Endive, Garlic, Herbs, Horse Radish, Lettuce, Mint, Mushrooms, Onions, Parsley, Peas, Potatoes, Radishes, Small salad, Spinach, Tomatoes, Turnips, and Veg. Marrows.

New Potatoes:—Jersey Kidney, 10s. to 12s. per cwt.; Round, 9s. to 10s.; French Round, 8s. to 9s.

PLANTS IN POTS.—WHOLESALE PRICES.

Table with 3 columns: Plant, Price (s. d. s. d.), and Plant, Price (s. d. s. d.). Includes items like Arum Lilies, Bedding Plants, Begonias, Bouvardias, Calceolarias, Cyperus, Dracena terminalis, Erica, Euonymus, Ferns, Ficus elasticus, Foliage Plants, and Hydrangea.

CUT FLOWERS.—WHOLESALE PRICES.

Table with 3 columns: Flower, Price (s. d. s. d.), and Flower, Price (s. d. s. d.). Includes items like Abutilon, Anemone, Arum Lilies, Azalea, Bouvardias, Calceolarias, Carnations, Cornflower, Eucharis, Forget-me-not, Gardenias, Heliotropes, Lily of the Valley, Mignonette, Pansies, Pelargoniums, and Spiræa.

SEEDS.

LONDON: June 23.—The attendance at market today was very small, and the amount of business doing was in proportion. No transactions are to be noted in Clover seed at the moment. Mustard and Rape still continue to be enquired for, but there is hardly so much doing in them as was the case last week. Canary is still slow of sale, while Hemp is almost entirely neglected. There is an increased enquiry for Trifolium, which may be ascribed to the extremely poor prospects of the new crop here, combined with the absence of any definite information from France, as to the probable extent of the yield there. Blue Peas continue to sell freely; Haricot Beans in fair demand.—John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.

HAY.

Tuesday's Whitechapel Market reports state that there was a large supply of fodder, which was chiefly of an inferior quality. Trade was dull, at the following quotations:—Prime Clover, 100s. to 130s.; inferior, 60s. to 95s.; prime meadow hay, 80s. to 105s.; inferior, 30s. to 70s.; and straw, 30s. to 39s. per load.—On Thursday there was a moderate supply of hay and straw on sale. The trade was dull, and prices were rather easier for hay, as follows:—Prime Clover, 100s. to 130s.; inferior, 60s. to 95s.; prime meadow hay, 80s. to 102s. 6d.; inferior, 30s. to 70s.; and straw, 30s. to 39s. per load.—Cumberland Market quotations:—Superior meadow hay, 98s. to 110s.; inferior, 40s. to 75s.; superior Clover, 120s. to 132s.; inferior, 84s. to 100s.; and straw, 33s. to 40s. per load.

POTATOS.

The Borough and Spitalfields Markets reports state that there has been a fair supply on sale, and trade ruled quiet at the following quotations:—Champions, 100s. to 120s. per ton; Victorias, 100s. to 120s.; German reds, 3s. to 5s. per bushel; New Lisbon, 8s. 6d. to 10s. per cwt.; Malta spring, 9s. to 10s.; Jersey kidneys, 12s. to 14s.; Cherbourg round, 9s.; do. kidneys, 11s.—Last week's imports were 1316 boxes and 5382 packages from Lisbon, 590 bags from Harlingen, 642 cases from Barfleure, 5 barrels from La Palmas, 167 sacks from Boulogne, 200 bags Hamburg, 237 baskets Rotterdam, and 2500 packages from Jersey.

Government Stock.—On Monday the closing price of Consols was, for delivery, 98½ to 98¾, and 98½ to 98¾ for the account. Tuesday's figures were, for delivery, 98½ to 98¾, and 98½ to 98¾ for the account. The final quotations of Wednesday were 98½ to 98¾ for both account and delivery. On Thursday Consols closed at 98½ to 98¾ for delivery, and 98½ to 98¾ for the account.

# HUGH LOW AND CO.

Have pleasure in informing their Friends and the Public that their

**STOCK OF ORCHIDS IS VERY EXTENSIVE,**  
and well worth the notice of intending Purchasers, who are cordially invited to an Inspection of the Plants.

*At the Clapton Nursery Orchids are grown in Eleven Houses, one of which is 155 ft. in length and 30 ft. in width.*

Mr. BOXALL has recently returned, bringing with him, in cases measuring over 30 tons, the fine Collection of PHALÆNOPSIS made during his stay in the Philippine Islands.

Eleven Span-roofed Houses, of an aggregate length of 976 feet, have been added to the Glass Structures of the Nursery, to meet the increasing demand for Ornamental and Flowering Plants.

CLAPTON NURSERY, LONDON, E.

**Gather Honey from Your Flowers.**  
**NEIGHBOUR'S Celebrated BEEHIVES.**  
PHILADELPHIA EXHIBITION, 1876.  
PARIS EXHIBITION, 1875, 1878.

Three Silver Prize Medals awarded George Neighbour & Sons.  
The IMPROVED COTTAGE BEEHIVE, as originally introduced by G. Neighbour & Sons, working three bell-glasses, is neatly and strongly made of straw; it has three windows in the lower Hive. This Hive will be found to possess many practical advantages, and is more easy of management than any other Beehive that has been introduced.

Price, complete £1 15 0  
Stand for ditto 0 10 6

Also **BAR FRAME HIVES** of most approved construction, at 7s. 6d., 12s. 6d., to 25s. each, and Philadelphia Frame Hives, complete with Cover and Stand, 42s.

An Italian Alp Queen, with full directions for uniting to Black Stocks, at current prices.

**FIGURIAN and ENGLISH BEES.**—Stocks and swarms may be obtained as heretofore.  
**THE APIARY.** By ALFRED NEIGHBOUR. 5s., postage 5d. A newly arranged CATALOGUE of other improved Hives, with Drawings and Prices, sent on receipt of two stamps.  
GEO. NEIGHBOUR AND SONS, 127, High Holborn, W.C., or 149, Regent Street, London, W.

**HILL AND SMITH'S BLACK VARNISH,**  
Oil Paint No Longer Necessary.  
for Preserving Ironwork, Wood, or Stone.  
(Registered Trade Mark.)

This VARNISH is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the advertisers, and its genuine good quality, notwithstanding a host of unprincipled imitators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requires no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, Kew Gardens, and at the seats of many hundreds of the Nobility and Gentry, from whom the most flattering testimonials have been received.  
Sold in casks of about 30 gallons each, at 1s. 6d. per gallon at the Manufactory, or 1s. 8d. per gallon carriage paid to any Station in the Kingdom.

**UNSOLICITED TESTIMONIAL.**  
"Pierrefield Park, June 21, 1876.—Sirs,—I have this day forwarded from Chepstow to your address a black varnish cask, to be filled and returned with as good Varnish as the last we had, which I candidly admit was the best we ever had. Address Varnish to Pierrefield Park, Chepstow.—I am, Sirs, yours respectfully, Wm. Cox."  
**CAUTION.**—HILL & SMITH would particularly warn their Customers against the various cheap Varnishes now so much advertised.

H & S's Varnish has been an article of common use on most of the large estates in the kingdom for upwards of thirty years; and their constantly increasing trade in it, and the numerous Testimonials they receive, stamp it as a truly genuine article. Every cask is legibly marked with their name and Registered Trade Mark as above, without which none is genuine.  
Large Illustrated CATALOGUE of Fencing, Hurdles, Field and Entrance Gates, &c., sent free on application to HILL AND SMITH, Brierley Hill Ironworks, Staffordshire; 118, Queen Victoria Street, London, E.C.; and 180, Buchanan Street, Glasgow.

**WATERPROOF TREE and PLANT LABELS,** specially adapted for Garden Purposes. They stand all weathers, and by using our Prepared Pencil the writing cannot be effaced, and remains discernible at all times. For sample and price apply to the Manufacturers, FISHER, CLARK AND CO., Boston.

**PAINT.**—Large quantity for sale, specially prepared for Horticultural Buildings, Greenhouses, &c., 2½d. per lb.—all colours. Improved Zinc White Paint, 4½d. per lb.—Cash.—A. LEETE & CO., 129, London Rd., Southwark, S.E.

Under the Patronage of the Queen.  
**J. SMITH'S IMPERISHABLE STRATFORD LABELS.**

The above Labels are made of a White Metal, with RAISED BLACK-FACED LETTERS.  
The *Gardeners' Magazine* says:—"We must give these the palm before all other plant labels, as the very first in merit."  
Samples and Price Lists free.

J. SMITH, The Royal Label Factory, Stratford-on-Avon.

**THE "ACME" LABELS**  
(REGISTERED).

Highly commended by all the Gardening Papers.

**IMPERISHABLE.**  
Specimens and Price List on application.  
SOLE MANUFACTURERS,

**STEVENS & PINCHES,**  
48, LEICESTER SQUARE, W.C., and 27, OXENDON STREET, S.W.

**GARDEN STAKES, LABELS, VIRGIN CORK, MATS, RAFFIA, &c.** None cheaper. Prices of WATSON AND SCULL, 90, Lower Thames St., London, E.C.

**NETTING FOR FRUIT TREES, SEED BEDS, RIPE STRAWBERRIES, &c.**  
TANNED NETTING for protecting the above from Frost, Blight, Birds, &c., 2 yards wide, 3d. per yard, or 100 yards 20s.; 4 yards wide, 6d. per yard, or 50 yards 20s.  
NEW TANNED NETTING, suited for any of the above purposes, or as a Fence for Fowls, 2 yards wide, 6d. per yard; 4 yards wide, 1s. per yard; ½-inch mesh, 4 yards wide, 1s. 6d. per yard.  
TIFFANY, 5s. and 6s. per piece of 20 yards.  
LAWN TENNIS NETS from 10s. to 25s.  
EATON AND DELLER, 6 & 7, Crooked Lane, London Bridge.

**"EUREKA" FUMIGATORS** are the best and cheapest for all purposes. May be had from all Seedsmen, &c., 2s., 2s. 9d., 4s. 3d., 6s. 6d. each, package extra. TOBACCO CLOTH, 100f. per pound. SEED DRILLS, CAP GLASSES, SYRINGES, &c. LISTS free. SYERS, Bowdon, Cheshire.

**X PIPES, — PIPES. — PIPES. X**  
The Cheapest House in the Trade for HOT-WATER PIPES and CONNECTIONS. 4-inch Pipes, 1s. 11d. per yard. Other sizes equally low. F. AND J. SILVESTER, Castle Hill Foundry, Engineering and Boiler Works, Newcastle, Staffordshire.

By Royal Letters Patent. **RITCHIE'S GAS LIGHTING and HEATING APPARATUS.**  
No Flue required. Specially adapted for Drying Newly-built Houses. Silver Medal awarded in 1878 at Wolverhampton Exhibition. The deleterious and unpleasant vapours arising from the burning of ordinary coal gas are prevented from escaping, and are made to circulate within the Apparatus or Stove in such a way that they become thoroughly condensed, and are carried off in the form of a liquid, in which will be found the sulphur and other poisons which are drawn from and would in the ordinary way be left in and mixed with the surrounding atmosphere; consequently health is not prejudicially affected, Works of Art, Plants, Pictures, Books, Furniture, &c., are not injured, and the atmosphere is rendered uncontaminated and perfectly healthy.  
Prices from 50s. to £10 10s.  
Full particulars and testimonials forwarded on application to RITCHIE AND CO., 23, St. Swinth's Lane, London, E.C.

**JONES'S PATENT "DOUBLE L" SADDLE BOILER.**

These Boilers possess all the advantages of the old Saddle Boiler, with the following improvements—viz., the water-space at back and over top of saddle increase the heating surface to such an extent that a "PATENT DOUBLE L SADDLE BOILER" will do about twice the amount of work with the same quantity of fuel; the cost of setting is also considerably reduced, and likewise the space occupied; at the same time these Boilers are simple in construction, and being made of wrought-iron are not liable to crack. They are made of the following sizes:—

Sizes.			To heat of 4-in. Pipe.	Price.
High.	Wide.	Long.	Feet.	£ s. d.
20 in.	18 in.	18 in.	300	7 0 0
20 "	18 "	24 "	400	8 0 0
20 "	18 "	30 "	500	9 0 0
24 "	24 "	24 "	700	12 0 0
24 "	24 "	30 "	850	14 0 0
24 "	24 "	36 "	1000	16 0 0
24 "	24 "	48 "	1400	20 0 0
28 "	28 "	60 "	1800	25 0 0

Larger sizes if required.

From Mr. CHARLES YOUNG, Nurseries, Balham Hill, S.W., May 29, 1873.  
"Having given your Patent 'Double L' Boilers a fair trial at my Nurseries, I beg to say that they are most satisfactory. I consider them the best in use, and without doubt the most economical of all boilers; they will burn the refuse of other tubular boilers I have in work."

PRICE LISTS of HOT-WATER PIPES and CONNECTIONS, with Boilers, of all sizes and shapes; or ESTIMATES for HOT-WATER APPARATUS, erected complete, will be sent on application.  
J. JONES AND SONS, Iron Merchants, 6, Bankside, Southwark, London, S.E.  
When ordering Boilers please refer to the above advertisement.

**JONES & ATTWOOD,**  
ENGINEERS and IRONFOUNDERS,  
STOURBRIDGE.

JONES'S IMPROVED EXPANSION JOINT. THE BEST HOT-WATER JOINT.

Medal Awarded Horticultural Show, Aston, 1875.

SIMPLE, DURABLE, NEAT, CHEAP. Specially adapted for CHURCHES, SCHOOLS, MANSIONS, PUBLIC BUILDINGS, &c.

Illustrated CIRCULAR and Price LIST; also Estimates for Heating with the most improved BOILERS, EXPANSION JOINT PIPES, or COILS, on application.

Silver Medal, 1874.

**THE TERMINAL SADDLE BOILER.**—First-class Certificate, 1867; Highly Commended, 1873; and First-class Certificate, 1875.

"This boiler possesses the rare merit of sucking all the heat from the fire."—Gardener's Magazine, p. 254.  
"I have no doubt the Best Boiler, that will burn any kind of fuel, is the Terminal Saddle."—Journal of Horticulture, p. 327.  
"For moderate cost and real efficiency the Terminal Saddle is one of the very best."—The Gardener, p. 95.  
Prospectus post-free.

T. JONES, Temple Street, Manchester.

**W. H. LASCELLES,**  
HORTICULTURAL BUILDER,  
121, BUNHILL ROW, LONDON, E.C.

J. MILLS, Horticultural and Steam Joinery Works, Broadwall, Stamford Street, Blackfriars, London, S.E.

**IRON CONSERVATORY,** 30 feet by 19 feet, for Sale, to clear site for building. Price £71, cost over £300. Apply, J. GROVER, Builder, Wilton Works, New North Road, N., who will send a Photo.

Two Gold Medals awarded to us by the Royal Horticultural Society, at the

Grand Show at Preston, July, 1878, out of Fourteen Competitors.

Having extensive works, special machinery, and first-class workmen, who have been many years in the trade, we are able to supply the very best class of buildings at an extremely low price. As we are the only firm in the Kingdom that has ever been awarded Two Gold Medals by the Royal Horticultural Society, this will be some proof of the quality of our productions.  
Our buildings are constructed so as to combine great strength, simplicity, and durability, with extreme lightness, and being made of the very best materials, will, with ordinary care, last a lifetime. The ventilators at top and bottom open the whole length with one handle to each series. The glass used is 21-oz. British sheet, and the paint the best genuine white lead and oil.  
HEATING APPARATUS, with thoroughly reliable Boilers supplied and fixed in the most practical and efficient manner, and guaranteed to work economically and answer its purpose in all seasons. We devote special personal attention to this branch of our business, and have never had a failure.

Plans, Estimates, and Catalogues free. Customers waited on in any part of the Kingdom.

WANT PLACES.

JOHN COWAN, The Vineyard and Nursery, Garston, can with every confidence recommend a GARDENER (married, without family), to any Nobleman or Gentleman requiring the services of a highly accomplished and thoroughly trustworthy man.

GARDENER (HEAD).—No children; thoroughly experienced. Highest character. Good Landscape.—M. M., Boddington's Library, Notting Hill Gate, London, W.

GARDENER (HEAD), where a thorough practical, energetic man is required.—Age 32, married; twenty years' experience in all branches of the profession, Early and Late Forcing. Five years' good character.—H. P., 2, Flora Villas, Grove Road, Brentford.

GARDENER (HEAD), where six or seven men are kept.—Age 39, married; twenty-six years' practical experience in all branches of the profession. Could Manage Meadow Land or Plantations. Twelve years' character as Head from present employer.—M. W., 61, Erompton Square, S.W.

GARDENER (HEAD).—Married; thoroughly understands Early and Late Forcing, Pines, Vines, Peaches, Strawberries, Vegetables, Stove and Greenhouse Plants; thoroughly understands Flower and Kitchen Gardening; also the Management of a Home Farm. Character will bear the strictest investigation.—S. O., 11, Clarence Villas, St. Mary's Grove, Richmond, Surrey.

GARDENER (HEAD, good WORKING), where two or more are kept.—Age 39, married, no family; thoroughly understands Vines, Cucumbers, Stove and Greenhouse Plants, and Flower and Kitchen Gardening. Good character.—A. A., Vine Cottage, East Barnet, Herts.

GARDENER (HEAD, WORKING).—Age 32, married, two children; thoroughly practical in all branches. Three years' character. Please state wages.—A. B., 35, Covent Garden, Leamington.

GARDENER (HEAD, WORKING), where two or three are kept.—Thoroughly energetic and competent in all branches. Testimonials satisfactory.—FOREMAN, Stowe House, Buckingham.

**GARDENER (HEAD, WORKING).**—Age 37, married, with family; practical experience. Nine years in present situation. Leaving through death. Highest testimonials.—S. R., Lanngrish House, Petersfield, Hants.

**GARDENER (HEAD, WORKING).**—Age 30, single; is well versed in the Cultivation of Stove and Greenhouse Plants, Orchids, Pines, Grapes, &c.; also Flower and Kitchen Gardening, and the general Management of a Nobleman's Establishment. Can be well recommended.—G. F., Railway, Wansford.

**GARDENER (HEAD, WORKING, where two or more are kept, or good SINGLE-HANDED).**—Age 32, married, two children; understands Stove and Greenhouse Plants, Vines, Cucumbers, and Flower and Kitchen Gardening. Four years and eight months' excellent character from present employer.—G. FREEMANTLE, Cumberland House, Kenley R. S. O., Surrey.

**GARDENER (HEAD, or good SINGLE-HANDED).**—Age 27; married, one child. Good character from present situation.—C. BARNARD, Cliffe Road, Higham, near Rochester.

**GARDENER (HEAD, or SINGLE-HANDED).**—Age 25; thoroughly understands his work. Four years' good character.—T. E. COLLINS, Blackbrook, Gros-mont, near Hereford.

**GARDENER.**—Wanted, by a young man, a situation in the houses, where two or more kept.—T. W., Mr. Wall, Rose Cottage, St. Margarets, Tackenhams.

**GARDENER.**—Age 23, single; no objection to driving or attending to poultry, &c. Twelve months' good character. Has not left present situation, where a fortnight's notice is required.—J. L., 4, Windmill Cottages, Fusham, London, S.W.

**GARDENER, or GARDENER and BAILIFF.**—High Low & Co. are desirous to procure employment, in either or both capacities, for a very worthy man, who has for many years held a responsible position on a large estate, and whom they can strongly recommend as one of the best general Gardeners known to them. He is of irreproachable character, trustworthy, industrious, punctual, a good man of business, of middle-age, married, but without family. Full particulars furnished on application.—Clapton Nursery, E.

**GARDENER (good SINGLE-HANDED).**—Middle-aged, single; well up to his duties. Good character.—G. F. E., Surrey Cottage, Hamilton Road, Lower Norwood, S.

**GARDENER (SINGLE-HANDED, or where help is given).**—Age 43, married. Understands Vines, Melons, Cucumbers, Stove, and Flower and Kitchen Gardening. Good character. Suburbs preferred.—GARDENER, 69, Naylor Road, Peckham, S. E.

**GARDENER (SINGLE-HANDED, or where another one is kept).**—Age 26, single; understands Vines, Cucumbers, Stove, Greenhouse, Conservatory, and Flower and Kitchen Gardening. Good character.—N. W., 9, Karlslake Terrace, Burnt Ash, Lee, Kent.

**GARDENER (SECOND).**—Age 23; six years' experience both indoors and out. Good character.—T. C., 27, Newcombe Street, Kensington, W.

**GARDENER (SECOND).**—Age 24, single; has had good experience. Two and a half years' good character. Please state terms.—A. B., Mr. Young, 1, High Street, Fulham, London, S.W.

**GARDENER (SECOND, or THIRD), in a good establishment.**—Age 25; excellent character. Scientific and good practical knowledge. State full particulars.—B. THOMPSON, 240, Whitworth Road, Rochdale.

**GARDENER (UNDER), where others are kept.**—Age 25; five years' good character.—A. GROOM, Fogmore, near Welwyn, Herts.

**GARDENER (UNDER).**—Age 19; used to both House and Outdoor work. Will be well recommended by late Head Gardener.—A., 65, Lenthall Road, Dalston, E.

**GARDENER (UNDER), in a Nursery or private establishment.**—Age 22; five years' experience in the Indoor and Outdoor branches. Total abstainer. Good references.—C. W. SUTTON, Groombridge, Tunbridge Wells.

**GARDENER (UNDER), in a Gentleman's Garden (in the Houses).**—Age 18; three years' good character. Both preferred.—J. CHARMAN, Mount Mascall, Bexley, Kent.

**FOREMAN, in the Houses.**—Age 26. Four and two years' character, from last and previous place.—T. PORTER, Glazenwood, Braintree, Essex.

**FOREMAN, or GARDENER (SECOND), in the Houses.**—Age 23, single; eight years' experience. Good references. Distance no object.—ALPHA, Mayston's Boot Stores, Church End, Hendon, Middlesex, N.W.

**FOREMAN, in a good Establishment.**—Age 23; nine years' experience in all branches. Good references.—A. B., Mr. Higgs, East Horsley, near Leatherhead, Surrey.

**FOREMAN, or FOREMAN and PROPAGATOR, for Market or otherwise.**—Well up in all branches.—A. Z., W. Stevens, near "Horse and Groom," Mitcham Common, Surrey.

**FOREMAN, and PROPAGATOR.**—Has a sound knowledge of the Propagation of Conifers, Rhododendrons, Roses, Clematis, Hard and Soft-wooded, Stove and Greenhouse Stuff.—H. M., Mr. Sissons, Church Garforth, near Leeds.

**TO GENTLEMEN and MARKET GROWERS.**—Gentlemen intending to Invest Capital with a view to establishing a lucrative Horticultural Business, to Grow Fruit, Cucumbers, choice Cut Bloom, Plants, &c., on an extensive scale; the Advertiser would Work up a first-class Connection, and take entire Management.—ALPHA, 36, Grove Road, Falcon Lane, Battersea, S.W.

To the Trade.

**MANAGER, or GENERAL FOREMAN,** in a first-class business.—Thorough knowledge of Roses, Stove and Greenhouse Plants, &c., and Routine of a good Trade.—REX, 2, Junction Terrace, Clapham Junction, S.W.

To the Seed Trade.

**SHOPMAN (ASSISTANT).**—Seven years' experience in England and Scotland. Thorough knowledge of the Trade. Good references.—J. CLOW, 5, Crompton Street, Derby.

"By a thorough knowledge of the natural laws which govern the operation of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast tables with a delicately-flavoured beverage which may save us many heavy doctor's bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly-nourished frame."—*Civil Service Gazette.*

"WARDE'S CAPILLARE

Is not a 'new discovery,' but one that has been in use for years . . . and so successfully as to produce many beautiful growths of hair, as also whiskers and moustaches in abundance. . . . The secret of its preparation has been purchased by Messrs. Warde & Co., and these gentlemen are giving to society at large—A REAL HAIR PRODUCER.—*Civil Service Gazette.*

A beautiful Head of Hair, Whiskers, Moustaches and Eyebrows positively produced by a course of

WARDE'S CAPILLARE (The "Comme il faut" Hair Producer).

(After a course of Warde's Capillare).

It preserves the natural colour of the hair; KEEPS IT FROM THINNING; is a SPECIFIC for PREMATURE BALDNESS; and thoroughly eradicates scruff and dandruff. Its fragrance and purity, moreover, recommend it FOR DAILY USE, as the best dressing for the Capillature.

Not genuine without Warde & Co.'s signature on the label, thus *Warde & Co.* Beware of those who copy the style of our Advertisements, and then "Caution" you that theirs have been so treated. Directions for use with each bottle.

Price, 2s. 6d. per bottle, three bottles 6s. 6d., Privately packed, carriage paid.

Can be obtained from all Chemists, per order on Wholesale Houses; or sent under cover, upon receipt of remittance, by G. WARDE & CO., 16, GT. MARLBRO ST., LONDON, W.

"Facts Speak Louder than Words."

The *Chemist and Druggist* says:—"Mr. Saville has sent for our inspection a large bundle of testimonials he has received from persons who have obtained the desired results, after using his preparation. We confess that, testimonial-hardened as we are, we could not help feeling convinced, from THEIR EVIDENTLY GENUINE CHARACTER, that Saville's Capillary Germinator has really a decided effect when the hair is falling or fallen off."

BEFORE USE. NEVER FAILS. AFTER USE.

The following is a fair specimen of the letters we are daily receiving, which prove the good qualities of

"SAVILLE'S CAPILLARY GERMINATOR" As a Real Producer of

WHISKERS, MOUSTACHES, EYEBROWS, &c., And as a Complete and Certain Cure for BALDNESS,

Or for Weak, Thin, and Falling Hair.

New Chester Road, Tranmere, Cheshire, April 30, 1880. "Dear Sir,—Will you kindly forward me another bottle of your "Capillary Germinator," as I have found it to be beneficial and quite capable of producing what I so earnestly desired. I shall recommend this wonderful producer to all my friends and comrades. I shall be in London soon, and shall have the pleasure of showing you my capital Whiskers and Moustaches, which your preparation has to my satisfaction produced.—I remain, yours respectfully, "W. C. MAGER."

Harmless, free from grease, nicely scented, will not stain nor injure the skin. The original of the above, with hundreds of similar letters, may be seen at any time.

Full particulars with forty testimonials sent free to any address.

Of all Chemists, Perfumers, &c. Sent, carriage paid, to any address, secretly packed, with testimonials, directions for use, &c., for 2s. 6d. Larger sizes, FREE, 5s., 9s., and 12s.

JOHN F. SAVILLE AND SONS, 146, Regent's Park Road, London, N.W.

Beware! Beware!!—Every genuine bottle has above title impressed in the glass. Do not be deceived into buying any imitations of this thoroughly reliable article.

DINNEFORD'S MAGNESIA.

The Medical Profession for over Forty Years have approved of this pure solution as the Best Remedy for

ACIDITY OF THE STOMACH, HEARTBURN, HEADACHE, GOUT, and INDIGESTION,

and as the safest Aperient for Delicate Constitutions, Ladies Children, and Infants.

DINNEFORD'S MAGNESIA.

HOLLOWAY'S OINTMENT and PILLS.

Rheumatism and Rheumatic Gout are the most dreaded of all diseases, because their victims know that they are safe at no season, and at no age secure. Holloway's Ointment, after fomentation of the painful parts, gives greater relief than any other application; but it must be diligently used to obtain this desirable result. It has been highly commended by rheumatic subjects of all ages and of both sexes, for rendering their attack less frequent and less vigorous, and for repressing the sour perspirations and soothing the nerves. In many cases Holloway's Ointment and Pills have proved the greatest blessings in removing rheumatism and rheumatic gout which had assailed men previously and at the prime of life.

Awarded the First Prize at the Sydney Exhibition.

# "THE COVENTRY" LAWN MOWER

(REGISTERED). MANUFACTURED BY

## NETTLEFOLD & SONS,

54, HIGH HOLBORN, LONDON, W.C.

PRICES:

8-inch	£2 2 0
10-inch	3 3 0
13-inch	4 4 0
15-inch	5 5 0
18-inch	6 6 0

The attention of the Public is invited to "THE COVENTRY" LAWN MOWER, which can be confidently recommended as the best and cheapest in the market; for lightness and ease in working it cannot be surpassed. It has all the improvements which have of late been introduced into this class of Machine, either in England or America. It will cut wet or dry grass of any length, will turn in its own width, and is so light that a lady can use a 15-inch Machine of this make with greater ease than a 10-inch of the ordinary kind. It is cheaper than any other Machine of its class before the public. It is made, as its name implies, at Coventry, by skilled English workmen, and of best English Steel and Iron. These Machines can also be SUPPLIED WITH ROLLERS at same price, and with Grass Boxes at a small extra cost.

## S. OWENS & CO., HYDRAULIC ENGINEERS, WHITEFRIARS STREET, LONDON, E.C.
